## 1. Introduction

Description

This software manual provides the essential information you need to start using your Universal Robots robot.

• Set the safety configuration parameters defined by the risk assessment (see 2 Software Safety Configuration on page 28).

All functions for using PolyScope can be found in this manual. Please refer to the 3rd party provider of any URcaps for their propriety documentation. The software manual may be used together with the Script Manual, if you are going to create scripts for your robot programs

### 1.1. Joint Description

#### Description

The Universal Robots robot arm is composed of tubes and joints. You use the PolyScope to coordinate the motion of these joints to move the robot arm. You attach tools to end of the robot arm, or Tool Flange . Moving the robot arm positions the tool. You cannot position the tool directly above, or directly below the Base.

- Base: where the robot is mounted.
- Shoulder and Elbow: make larger movements.
- Wrist 1 and Wrist 2: make finer movements.
- Wrist 3: where the tool is attached to the Tool Flange.

### 1.2. Robot Arm Installation

Description	Install and power on the robot arm and Control Box to start using PolyScope.	
Assemble the robot	You have to assemble the robot arm, Control Box and Teach Pendant to be able to continue.	
	1. Unpack the robot arm and the Control Box.	
	2. Mount the robot arm on a sturdy, vibration-free surface.	
	Verify the surface can withstand at least 10 times the full torque of the base joint and at least 5 times the weight of the robot arm.	
	3. Place the Control Box on its Foot.	
	4. Connect the robot cable to the robot arm and the Control Box.	
	5. Plug in the mains, or main power cable, of the Control Box.	
	WARNING Failure to secure the robot arm to a sturdy surface can lead to injury	

· Ensure the robot arm is secured to a sturdy surface

caused by the robot falling.

### 1.3. PolyScope Overview

#### Description

PolyScope is the Graphical User Interface (GUI) on the **Teach Pendant** that operates the robot arm via a touch screen. You create, load and execute programs for the robot in PolyScope. The PolyScope interface is divided as shown in the following illustration:

- A: Header with icons/tabs that make interactive screens available to you.
- B: Footer with buttons that control your loaded program/s.
- C: Screen with fields and options to manage and monitor robot actions.

	PP A <unnamed> INSTA default New.</unnamed>	Open Save	сс —
Wha	at would you like to do fi	rst?	
RUN A PROGRAM	PROGRAM THE ROBOT	CONFIGURE ROBOT INSTALLATION	
Don't show this message again			
Speed	■ 100% <b>B</b> (		:34:01 ly 7, 2018

#### Using the Touch Screen

The touch sensitivity is designed to avoid false selections on PolyScope, and to prevent unexpected motion of the robot.

The Teach Pendant touch screen is optimized for use in industrial environments. Unlike consumer electronics, Teach Pendant touch screen sensitivity is, by design, more resistant to environmental factors such as:

- water droplets and/or machine coolant droplets
- · radio wave emissions
- other conducted noise from the operating environment.

For best results, use the tip of your finger to make a selection on the screen. In this manual, this is referred to as a "tap".

A commercially available stylus may be used to make selections on the screen if desired.

### 1.3.1. Icons/Tabs On PolyScope

Description

The following section lists and defines the icons/tabs and buttons in the PolyScope interface.

Header Icons / Functions

Run is a simple means of operating the robot using pre-written programs.

Program creates and/or modifies robot programs.

**Installation** configures robot arm settings and external equipment e.g. mounting and safety.

Move controls and/or regulates robot movement.

I/O monitors and sets live Input/Output signals to and from robot control box.

Log indicates robot health as well as any warning or error messages.

New... Open... Save... Program and Installation Manager selects

and displays active program and installation. The Program and Installation Manager includes: File Path, New, Open and Save.

New... creates a new Program or Installation.

ີ •າ... 0

Open... opens a previously created and saved Program or Installation.

Save... saves a Program, Installation or both at the same time.

Operational modes

Automatic indicates the operational mode of the robot is set to Automatic. Tap it to switch to the Manual operational mode.

Manual indicates the operational mode of the robot is set to Manual. Tap it to switch to the Automatic operational mode.

RemoteThe Local mode and Remote mode icons only become accessible if you enable RemoteControlControl.

**Local** indicates the robot can be controlled locally. Tap it to switch to Remote control.

**Remote** indicates the robot can be controlled from a remote location. Tap it to switch to Local control.

cccc cccc

Safety Checksum displays the active safety configuration.

Hamburger Menu accesses PolyScope Help, About and Settings.

Footer Icons / Functions

Initialize manages robot state. When RED, press it to make the robot operational.

Speed 100% Speed Slider shows in real time the relative speed at which the robot arm moves, taking safety settings into account.

Simulation

Simulation button toggles a program execution

between Simulation Mode and the Real Robot. When running in Simulation Mode, the Robot Arm does not move. Therefore, the robot cannot damage itself or nearby equipment in a collision. If you are unsure what the Robot Arm will do, use Simulation Mode to test programs.

Play starts current loaded robot Program.

Step allows a Program to be run single-stepped.

Stop halts current loaded robot Program.

High Speed	High Speed Manual Mode is a hold-to-run function, only available in Manual mode when a
Manual	Three-Position Enabling Device is configured.
Mode	250mm/s Llich Crossed Menuel Medeollows both tool encoded and allow around to

**250mm/s** High Speed Manual Modeallows both tool speed and elbow speed to temporarily exceed 250mm/s.

### 1.4. Freedrive

#### Description

Freedrive allows the robot arm to be manually pulled into desired positions For most robot sizes, the most typical way to enable Freedrive is to press the Freedrive button on the Teach Pendant. More ways to enable and use Freedrive are described in the following sections.

In Freedrive, the robot arm joints move with little resistance because the brakes are released. Resistance increases as the robot arm in Freedrive approaches a predefined limit or plane. This makes pulling the robot into position feel heavy.

### WARNING

Injury to personnel can occur due to unexpected motion.

- Verify the configured payload is the payload being used.
- Verify the correct payload is securely attached to the tool flange.

#### Enabling Freedrive

- You can enable Freedrive in the following ways:
  - Use the 3PE Teach Pendant.
  - Use the Freedrive on robot.
  - Use I/O Actions.

### NOTICE

Enabling Freedrive while you are moving the robot arm, can cause it to drift leading to faults.

• Do not enable Freedrive while you are pushing or touching the robot.

3PE Teach Pendant

To use the 3PE TP button to freedrive the robot arm:

1. Rapidly light-press, release, light-press again and keep holding the 3PE button in this position.

Now you can pull the robot arm into a desired position, while the light-press is maintained.

Freedrive on	To use Freedrive on robot to freedrive the robot arm:
robot	1. Press-and-hold the button of switch configured for <b>Freedrive on robot</b> .
	<ol><li>When the Freedrive panel appears in PolyScope, select the desired movement type for the robot arm's joints. Or use the list of axes to customize the movement type.</li></ol>
	3. You can define the type of feature if required, by selecting an option from the Feature dropdown list.
	The robot arm can stop moving if it approaches a singularity scenario. Tap <b>All axes are free</b> in the Freedrive panel to resume movement.
	4. Move the robot arm as desired.
Backdrive	During initialization of the robot arm, minor vibrations may be observed when the robot brakes are released. In some situations, such as when the robot is close to collision, these vibrations are undesirable. Use Backdrive to force specific joints to a desired position without releasing all brakes in the robot arm.

### 1.4.1. Freedrive Panel

Description	When the robot arm is in Freedrive, a panel appears on PolyScope, as illustrated below.
	Freedrive Press & Hold
	Constrained Control
	Feature: Base
	All axes are free          X       Image: Constraint of the second se
To access the Freedrive Panel	<ol> <li>In the Header, tap the Move tab.</li> <li>At the bottom of the screen, tap Freedrive. The Freedrive Panel opens.</li> </ol>
	<ol> <li>Press and hold the Freedrive button inside the Panel.</li> </ol>
	You can the robot arm manually, similar to pressing the Freedrive button located on the Teach Pendant.
	A LED indicates when the robot arm approaches a singularity position. The LED is detailed in the following section.
LED in Freedrive	The LED on the status bar of the Freedrive panel indicates:
panel	<ul> <li>When one or more joints are approaching their joint limits.</li> <li>When the robot arm's positioning is approaching singularity. Resistance increases as the robot approaches singularity, making it feel heavy to position.</li> </ul>
Freedrive Panel icons	You can lock one or more of the axes allowing the TCP to move in a particular direction, as defined in the table below.

All axes are free	Movement is allowed through all axes.
Plane	Movement is only allowed through the X-axis and Y-axis.
Translation	Movement is allowed through all axes, without rotation.
Rotation	Movement is allowed through all axes, in a spherical motion, around the TCP.

### CAUTION

Moving the robot arm in some axes when a tool is attached, can present a pinch point.

• Use caution when moving the robot arm in any axis.

### 1.5. Backdrive

Description

Backdrive is a Manual Mode used to force specific joints to a desired position without releasing all brakes in the robot arm.

This is sometimes necessary if the robot arm is close to collision and the vibrations that accompany a full restart are not desired.

The robot joints feel heavy to move, while Backdrive is in use.

You can use any of the following sequences to enable Backdrive:

- 3PE Teach Pendant
- 3PE device/switch
- Freedrive on robot

3PE Teach Pendant	<ol> <li>To use the 3PE TP button to backdrive the robot arm.</li> <li>On the Initialize screen, tap ON to start the power up sequence.</li> <li>When the robot state is Teach Pendant 3PE Stop, light-press, then light-press- and-hold, the 3PE TP button. The robot state changes to Backdrive.</li> <li>Now you can apply significant pressure to release the brake in a desired joint to move the robot arm. As long as light-press is maintained on the 3PE button, Backdrive is enabled,</li> </ol>
	allowing the arm to move.
3PE	To use a 3PE device/switch to backdrive the robot arm.
device/switch	1. On the Initialize screen, tap <b>ON</b> to start the power up sequence.
	<ol> <li>When the robot state is Teach Pendant 3PE Stop, light-press, then light-press- and-hold, the 3PE TP button. The robot state changes to System 3PE Stop.</li> </ol>
	<ol> <li>Press and hold the 3PE device/switch. The robot state changes to <b>Backdrive</b>.</li> </ol>
	<ol> <li>Now you can apply significant pressure to release the brake in a desired joint to move the robot arm.</li> <li>As long as the hold is maintained on both the 3PE device/switch and the 3PE TP button, Backdrive is enabled, allowing the arm to move.</li> </ol>
Freedrive on	To use Freedrive on robot to backdrive the robot arm.
robot	1. On the Initialize screen, tap <b>ON</b> to start the power up sequence.
	<ol> <li>When the robot state is Teach Pendant 3PE Stop, press and hold the Freedrive on robot.</li> <li>The robot state changes to Backdrive.</li> </ol>
	<ol> <li>Now you can apply significant pressure to release the brake in a desired joint to move the robot arm.</li> <li>As long as the hold is maintained on the Freedrive on robot, Backdrive is enabled, allowing the arm to move.</li> </ol>

### 1.5.1. Backdrive Inspection

**Description** If the robot is close to colliding with something, you can use Backdrive to move the robot arm to a safe position before initializing.

### **3PE Teach Pendant**

Enable Backdrive	1.	Press ON to enab	le power.	Status cha	ange		Robot Ac	tive	
		Robot Status							
			Power	Booting Complete	Rob		Brake Release	Robot Operational	
				🔵 START	-			OFF	
		Payload		🥂 Warning! Star		f the robot w	vhen starting it!		
		Payload				RODOL			
		Active Payload is used to te	mporarily overwrite	the Installation Payloa	d.				
		Active Payload	Instal <b>0.0</b> 0	lation Payload <b>0</b> kg				R A	
		Exit							

2. Press and hold Freedrive. Status changes to Backdrive

	BAC	KDRIVE	
	•		• OFF
ayload		Robot	
Active Payload is used to tempo	rarily overwrite the Installation Payload.		
	Installation Payload		Power ON the robot first

3. Move robot as in Freedrive mode. Joint brakes are released where needed once the Freedrive button is activated.

In Backdrive Mode the robot is "heavy" to move around.

### MANDATORY ACTION

You must test Backdrive mode on all joints.

Safety settings	Verify the robot safety settings comply with the robot installation risk assessment.
Additional safety inputs and outputs are still functioning	Check which safety inputs and outputs are active and that they can be triggered via PolyScope or external devices.

### 1.6. Quick System Start-up

Quick System Start

#### MANDATORY ACTION

Before using the PolyScope, verify that the robot arm and Control Box are correctly installed.

This is how you quickly start up the robot.

- 1. On the Teach Pendant, press the emergency stop button.
- 2. On the Teach Pendant, press the power button and allow the system to start, displaying text on the **PolyScope**.
- 3. A popup appears on the touch screen indicating that the system is ready and that the robot must be initialized.
- 4. In the popup dialog, tap Go to Initialize Screen to access the Initialize screen.
- 5. Unlock the emergency stop button to change the robot state from **Emergency** Stopped to Power off.
- 6. Step outside the reach (workspace) of the robot.
- 7. On the **Initialize Robot** screen, tap the **ON** button and allow the robot state to change to **Idle**.
- 8. In the **Payload** field, in **Active Payload**, verify the payload mass. You can also verify that the mounting position is correct, in the **Robot** field.
- 9. Tap the **Start** button, for the robot to release its brake system. The robot vibrates and makes clicking sounds, indicating it is ready to be programmed.

### NOTICE

Learn to program your Universal Robots robot on <u>www.universal-</u> robots.com/academy/

### 1.7. The First Program

#### Description

A program is a list of commands telling the robot what to do. For most tasks, programming is done entirely using the PolyScope software. PolyScope allows you to teach the robot arm how to move using a series of waypoints to set up a path for the robot arm to follow.

Use the Move tab to move the Robot Arm to a desired position, or teach the position by pulling the Robot Arm into place while holding down the Freedrive button at the top of the Teach Pendant.

You can create a program can to send I/O signals to other machines at certain points in the robot's path, and perform commands like **if...then** and **loop**, based on variables and I/O signals.

To create a simple program

- 1. On PolyScope, in the Header File Path, tap New... and select Program.
- 2. Under Basic, tap **Waypoint** to add a waypoint to the program tree. A default MoveJ is also added to the program tree.
- 3. Select the new waypoint and in the Command tab, tap Waypoint.
- 4. On the Move Tool screen, move the robot arm by pressing the move arrows. You can also move the robot arm by holding down the Freedrive button and pulling the Robot Arm into desired positions.
- 5. Once the robot arm is in position, press **OK** and the new waypoint displays as Waypoint\_1.
- 6. Follow steps 2 to 5 to create Waypoint\_2.
- 7. Select Waypoint\_2 and press the Move Up arrow until it is above Waypoint\_1 to change the order of the movements.
- Stand clear, hold on to the emergency stop button and in the PolyScope Footer, press Play button for the Robot Arm to move between Waypoint\_1 and Waypoint\_2. Congratulations! You have now produced your first robot program that moves the Robot Arm between the two given waypoints.

#### NOTICE

- 1. Do not drive the robot into itself or anything else as this may cause damage to the robot.
- This is only a quick start guide to show how easy it is to use a UR robot. It assumes a harmless environment and a very careful user. Do not increase the speed or acceleration above the default values. Always conduct a risk assessment before placing the robot into operation.

### WARNING

Keep your head and torso outside the reach (workspace) of the robot. Do not place fingers where they can be caught.

### 1.8. Cybersecurity Threat Assessment

### 1.8.1. General Cybersecurity

#### Description

Connecting a Universal Robots robot to a network can introduce cybersecurity risks. These risks can be mitigated by using qualified personnel and implementing specific measures for protecting the robot's cybersecurity. Implementing cybersecurity measures requires conducting a cybersecurity threat assessment.

The purpose is to:

- · Identify threats
- Define trust zones and conduits
- · Specify the requirements of each component in the application

### WARNING

Failure to conduct a cybersecurity risk assessment can place the robot at risk.

• The integrator or competent, qualified personnel shall conduct a cybersecurity risk assessment.

### NOTICE

Only competent, qualified personnel shall be responsible for determining the need for specific cybersecurity measures and for providing the required cybersecurity measures.

### 1.8.2. Cybersecurity Requirements

Description	Configuring your network and securing your robot requires you to implement the threat
	measures for cybersecurity.
	Follow all the requirements before you start configure your network, then verify the robot
	setup is secure.

Cybersecurity

- Operating personnel must have a thorough understanding of general cybersecurity principles and advanced technologies as used in the UR robot.
  - Physical security measures must be implemented to allow only authorized personnel physical access to the robot.
- There must be adequate control of all access points. For example: locks on doors, badge systems, physical access control in general.

#### WARNING

Connecting the robot to a network that is not properly secured, can introduce security and safety risks.

 Only connect your robot to a trusted and properly secured network.

Network configuration requirements	<ul><li>Only trusted devices are to be connected to the local network.</li><li>There must be no inbound connections from adjacent networks to the robot.</li></ul>
	<ul> <li>Outgoing connections from the robot are to be restricted to allow the smalles relevant set of specific ports, protocols and addresses.</li> </ul>
	<ul> <li>Only URCaps and magic scripts from trusted partners can be used, and only verifying their authenticity and integrity</li> </ul>
Robot setup	<ul> <li>Change the default password to a new, strong password.</li> </ul>

- from the robot are to be restricted to allow the smallest ports, protocols and addresses.
- gic scripts from trusted partners can be used, and only after icity and integrity

Robot setup security

requirements

- Disable the "Magic Files" when not actively used (PolyScope 5).
- · Disable SSH access when not needed. Prefer key-based authentication over password-based authentication
- Set the robot firewall to the most restrictive usable settings and disable all unused interfaces and services, close ports and restrict IP addresses

e-Series

### 1.8.3. Cybersecurity Hardening Guidelines

#### Description

Although PolyScope includes many features for keeping the network connection secure, you can harden security by observing to following guidelines:

• Before connecting your robot to any network, always change the default password to a strong password.

Í	<ul><li>NOTICE</li><li>You cannot retrieve or reset a forgotten or lost password.</li><li>Store all passwords securely.</li></ul>
Use the buil	It-in settings to restrict the network access to the robot as much as

- possible.
  Some communication interfaces have no method of authenticating and encrypting communication. This is a security risk. Consider appropriate mitigating measures,
- SSH tunneling (Local port forwarding) must be used to access robot interfaces from other devices if the connection crosses the trust zone boundary.

based on your cybersecurity threat assessment.

- Remove sensitive data from the robot before it is decommissioned. Pay particular attention to the URCaps and data in the program folder.
  - To ensure secure removal of highly sensitive data, securely wipe or destroy the SD card.

### 1.9. Modes

#### Description

You access and activate different modes using Teach Pendant or the Dashboard Server. If an external mode selector is integrated, it control the modes - not PolyScope or the Dashboard Server.

Automatic Mode Once activated, the robot can only execute a program of pre-defined tasks. You cannot modify or save programs and installations. Manual Mode Once activated, you can program the robot. You can modify and save programs and installations.

The speeds used in Manual Mode must be limited to prevent injury. When the robot is operating in Manual Mode, a person could be positioned within reach of the robot. The speed must be limited to the value that is appropriate for the application risk assessment.

#### WARNING

Injury can occur if the speed used, while the robot is operating in Manual Mode, is too high.

High Speed Manual Mode can be used. It allows both tool speed and elbow speed to temporarily exceed 250 mm/s, while a hold-to-run is used. Hold-to-run is performed by continuous contact with the Speed Slider.

The robot performs a Safeguard Stop in Manual mode, if a Three-Position Enabling Device is configured, and either released (not pressed) or it is fully compressed.

Switching between Automatic mode to Manual mode requires the Three-Position Enabling Device to be fully released and pressed again to allow the robot to move. When using High Speed Manual Mode, use safety joint limits or safety planes to restrict the robot's moving space.

### Mode switching

Operational mode	Manual	Automatic	
Freedrive	x	*	
Move robot with arrows on Move Tab	х	*	
Edit & save program & installation	х		
Execute Programs	Reduced speed**	*	
Start program from selected node	х		
*Only when no Three-Position Enabling Device is configured. ** If a Three-Position Enabling Device is configured, the robot operates at Manual			
Reduced Speed unless High Speed Manual Mode is activated.			

### WARNING

- Any suspended safeguards must be returned to full functionality before selecting Automatic Mode.
- Wherever possible, Manual Mode shall only be used with all persons located outside the safeguarded space.
- If an external mode selector is used, it must be placed outside the safeguarded space.
- No-one is to enter, or be within, the safeguarded space in Automatic Mode, unless safeguarding is used or the collaborative application is validated for power and force limiting (PFL).

#### Three-Position Enabling Device

When a Three-Position Enabling Device is used and the robot is in Manual Mode, movement requires pressing the Three-Position Enabling Device to the center-on position. The Three-Position Enabling Device has no effect in Automatic Mode.

#### NOTICE

• Some UR robot sizes might not be equipped with a Three-Position Enabling Device. If the risk assessment requires the enabling device, a 3PE Teach Pendant must be used.

A 3PE Teach Pendant (3PE TP) is recommended for programming. If another person can be within the safeguarded space when in Manual Mode, an additional device can be integrated and configured for the additional person's use.

# 2. Software Safety Configuration

Description

This section covers how to access the robot safety settings. It is made up of items that help you set up the robot Safety Configuration.

### WARNING

Before you configure your robot safety settings, your integrator must conduct a risk assessment to guarantee the safety of personnel and equipment around the robot. A risk assessment is an evaluation of all work procedures throughout the robot lifetime, conducted in order to apply correct safety configuration settings. You must set the following in accordance with the risk assessment.

- 1. The integrator must prevent unauthorized persons from changing the safety configuration e.g. installing password protection.
- 2. Use and configuration of the safety-related functions and interfaces for a specific robot application.
- 3. Safety configuration settings for set-up and teaching before the robot arm is powered on for the first time.
- 4. All safety configuration settings accessible on this screen and sub-tabs.
- 5. The integrator must ensure that all changes to the safety configuration settings comply with the risk assessment.

Accessing	Safety Settings are password protected and can only be configured once a password is set
Software	and subsequently used.
Safety	To access the software safety settings
Settings	1. In your PolyScope header, tap the Installation icon.

- 2. In the Side Menu on the left of the screen, tap **Safety**.
- 3. Observe that the Robot Limits screen displays, but settings are inaccessible.
- 4. If a **Safety password** was previously set, enter the password and press **Unlock** to make settings accessible. Note: Once Safety settings are unlocked, all settings are now active.
- 5. Press Lock tab or navigate away from the Safety menu to lock all Safety item settings again.

	Elbow Force	150	.0 N	120.0	N	
	S	afety password	Uni	ock Lock		Apply

### 2.1. Setting a Software Safety Password

Description	You must set a password to Unlock all safety settings that make up your Safety Configuration. If no safety password is applied, you are prompted to set it up.			
To set a Software Safety password	You can tap the <b>Lock</b> tab to lock all Safety settings again or simply navigate to a screen outside of the Safety menu.			
	<ol> <li>In your PolyScope header right corner, press the Hamburger menu and select Settings.</li> </ol>			
	2. On the left of the screen, in the blue menu, press Password and select Safety.			
	3. In <b>New password</b> , type a password.			
	4. Now, in Confirm new password, type the same password and press Apply.			
	5. In the bottom left of the blue menu, press <b>Exit</b> to return to previous screen.			

Safety password Unlock Lock

## 2.2. Changing the Software Safety Configuration

Description	Changes to the Safety Configuration settings must comply with the risk assessment conducted by the integrator.			
Recommended procedure for the integrator:	<ul> <li>To change the safety configuration</li> <li>1. Verify that changes comply with the risk assessment conducted by the integrator.</li> <li>2. Adjust safety settings to the appropriate level defined by the risk assessment conducted by the integrator.</li> <li>3. Verify that the settings are applied.</li> <li>4. Place following text in the operators' manuals:</li> <li>Before working near the robot, make sure that the safety configuration is as expected. This can be verified e.g. by inspecting the Safety Checksum in the top right corner of PolyScope for any changes.</li> </ul>			

## 2.3. Applying a New Software Safety Configuration

#### Description

The robot is powered off while you make changes to the configuration. Your changes only take effect after you tap the **Apply** button. The robot cannot be powered on again until you select **Apply and Restart** to visually inspect your robot Safety Configuration which, for safety reasons, is displayed in SI Units in a popup.

You can select **Revert Changes** to return to the previous configuration. When your visual inspection is complete you can select **Confirm Safety Configuration** and the changes are automatically saved as part of the current robot installation.

### 2.3.1. Safety Checksum

#### Description

The **Safety Checksum** icon displays your applied robot safety configuration.

It could be four or eight digits.

A four-digit Checksum should be read from top to bottom and left to right, while an eightdigit Checksum is read left to right, top row first. Different text and/or colors indicate changes to the applied safety configuration.

The **Safety Checksum** changes if you change the **Safety Functions** settings, because the **Safety Checksum** is only generated by the safety settings. You must apply your changes to the **Safety Configuration** for the **Safety Checksum** to reflect your changes.

## 2.4. Safety Configuration without Teach Pendant

### Description

You can use the robot without attaching the Teach Pendant. Removing the Teach Pendant requires defining another Emergency Stop source. You must specify if the Teach Pendant is attached to avoid triggering a safety violation.

#### CAUTION

If the Teach Pendant is detached or disconnected from the robot, the Emergency Stop button is no longer active. You must remove the Teach Pendant from the vicinity of the robot.

To safely remove the Teach Pendant	The robot can be used without PolyScope as the programming interface. To configure the robot without a Teach Pendant
	1. In the Header tap Installation.
	2. In the Side Menu on left tap Safety and select Hardware.
	3. Input Safety password and Unlock the screen.
	4. Deselect Teach Pendant to use robot without PolyScope interface.

5. Press Save and restart to implement changes.

### 2.5. Software Safety Modes

Description

Under normal conditions, i.e. when no protective stop is in effect, the safety system operates in a Safety Mode associated with a set of safety limits.

- Normal is the safety configuration that is active by default
- Reduced is the safety configuration that is active when the robot Tool Center Point (TCP) is positioned beyond a Trigger Reduced plane, or when triggered using a configurable input.
- **Recovery mode** activates when a safety limit from the active limit set is violated, the robot arm performs a Stop Category 0.

If an active safety limit, such as a joint position limit or a safety boundary, is in violation when the robot arm is powered on, the robot arm starts up in recovery mode. This makes it possible to move the robot arm back within the safety limits.

In Recovery mode, the movement of the robot arm is restricted by a fixed limit that you cannot customize.

#### WARNING

Limits for **joint position**, **tool position** and **tool orientation** are disabled in Recovery mode, so take caution when moving the robot arm back within the limits.

The menu of the Safety Configuration screen enables the user to define separate sets of safety limits for both configurations: Normal and Reduced. For the tool and joints, reduced limits for speed and momentum are required to be more restrictive than their Normal mode counterparts.

To Switch	<ol> <li>In the Header, select the profile icon.</li> <li>Automatic indicates the operational mode of the robot is set to</li></ol>
Modes: PolyScope	Automatic. <li>Manual indicates the operational mode of the robot is set to Manual.</li>
Using the Dashboard Server	<ol> <li>Connect to the Dashboard server.</li> <li>Use the Set Operational Mode commands.         <ul> <li>Set Operational Mode Automatic</li> <li>Set Operational Mode Manual</li> <li>Clear Operational Mode</li> </ul> </li> </ol>

### 2.6. Software Safety Limits

#### Description The safety system limits are defined in the Safety Configuration . The safety system receives values from the input fields and detects any violation if any the values are exceeded. The robot controller prevents violations by making a robot stop or by reducing the speed.

### 2.6.1. Robot Limits

Description	Robot Limits restrict general robot movements. The Robot Limits screen has two configuration options: <b>Factory Presets</b> and <b>Custom</b> .
Factory Presets	Factory Presets is where you can use the slider to select a predefined safety setting . The values in the table are updated to reflect the preset values ranging from <b>Most Restricted</b> to <b>Least Restricted</b>
	NOTICE

NOTICE
Slider va

alues are only suggestions and do not substitute a proper risk assessment.

General	! DANGER							
Safety		arameters different from those		by the risk assessmer	t can result in I	nazards that are not		
Robot Limits	reasonably eliminated or risks	that are not sufficiently reduced	d.					
Joint Limits								
Planes	Factory Presets			•				
! Tool Position		Most Restricted	Most Restricted			Least Restricted		
Tool Direction	OCustom							
I/O	Ŭ							
Hardware	Limit	Normal		Reduced				
PROFIsafe	Power	300		20	0 W

URCaps	Elbow Speed	1500		75	0 mm/s			
	Elbow Force	150.0	Ν	120	0 N			
	S	afety password		Unlock Lock		Apply		

## Custom Custom is where you can set Limits on how the robot functions and monitor the associated Tolerance.

Power	Limits maximum mechanical work produced by the robot in the environment. This limit considers the payload a part of the robot and not of the environment.		
Momentum	Limits maximum robot momentum.		
Stopping Time	Limits maximum time it takes the robot to stop e.g. when an emergency stop is activated.		
Stopping Distance	Limits maximum distance the robot tool or elbow can travel while stopping.           Image: NOTICE         NOTICE           Restricting stopping time and distance affect overall robot speed. For example, if stopping time is set to 300 ms, the maximum robot speed is limited allowing the robot to stop within 300 ms.		
Tool Speed	Limits maximum robot tool speed.		
Tool Force	Limits maximum force that the robot tool exerts on the environment to prevent clamping situations.		
Elbow Speed	Limits maximum robot elbow speed.		
Elbow Force	Limits maximum force that the elbow exerts on the environment to prevent clamping situations.		

The tool speed and force are limited at the tool flange and the center of the two user-defined tool positions.

#### NOTICE

You can switch back to **Factory Presets** for all robot limits to reset to their default settings.

### 2.6.2. Joint Limits

#### Description

Joint limits allow you to restrict individual robot joint movements in joint space i.e. joint rotational position and joint rotational speed. Joint limiting can also be called software based axis limiting. The joint limit options are: **Maximum speed** and **Position range**.

	Position rang	je						
<ul> <li>Safety</li> </ul>	Joints	Range	Normal	Mode	Reduced	d Mode

#### Input The inputs are described in the tables below:

#### Signals

Emergency Stop Button	Performs a Stop Category 1 (IEC 60204-1) informing other machines using the System Stop output if that output is defined. A stop is initiated in anything connected to the output.					
Robot Emergency Stop	Performs a Stop Category 1 (IEC 60204-1) via Control Box input, informing other machines using the System Emergency Stop Output if that output is defined.					
External Emergency Stop	Performs a Stop Category 1 (IEC 60204-1) on robot only.					
Reduced	All safety limits can be applied while the robot is using a <b>Normal</b> configuration, or a <b>Reduced</b> configuration. When configured, a low signal sent to the inputs causes the safety system to transition to the reduced configuration. The robot arm decelerates to satisfy the reduced parameters. The safety system guarantees the robot is within reduced limits less than 0.5s after the input is triggered. If the robot arm continues to violate any of the reduced limits, a Stop Category 0 is triggered. Trigger planes can also cause a transition to the reduced configuration. The safety system transitions to the normal configuration in the same way.					

Operational Mode	When an external mode selection is used it switches between <b>Automatic Mode</b> and <b>Manual Mode</b> . The robot is in Automatic mode when input is <i>low</i> and Manual mode when the input is <i>high</i> .
Safeguard Reset	Returns from the Safeguard Stop state, when a rising edge on the Safeguard Reset input occurs. When a Safeguard Stop occurs, this input ensures that the Safeguard Stop state continues until a reset is triggered.
Safeguard	A stop triggered by a safeguard input. Performs a Stop Category 2 (IEC 60204-1) in all modes, when triggered by a Safeguard.
Automatic Mode Safeguard Stop	Performs a Stop Category 2 (IEC 60204-1) in Automatic mode ONLY. Automatic Mode Safeguard Stop can only be selected when a Three- Position Enabling Device is configured and installed.
Automatic Mode Safeguard Reset	Returns from the Automatic Mode Safeguard Stop state when a rising edge on the Automatic Mode Safeguard Reset input occurs.
3-Position Enabling Device	In Manual Mode, an external 3-Position Enabling Device must be pressed and held in the center-on position to move the robot. If you are using a built-in 3-Position Enabling Device, the button must be pressed and held in the mid position to move the robot.
Freedrive on robot	You can configure the Freedrive input to enable and use Freedrive without pressing the Freedrive button on a standard TP, or without having to press-and-hold any of the buttons on the 3PE TP in the light-press position.

#### **Input** The inputs are described in the tables below:

#### Signals

#### WARNING

When the default Safeguard Reset is disabled, an automatic reset happens when the safeguard no longer triggers a stop.

This can happen if a person passes though the field of the safeguard. If a person is not detected by the safeguard and the person is exposed to hazards, automatic reset is forbidden by standards.

• Use the external reset to ensure resetting only when a person is not exposed to hazards.

#### WARNING

When Automatic Mode Safeguard stop is enabled, a safeguard Stop is not triggered in Manual Mode.

Output All safety outputs go low in the event of a safety system violation or fault. This means the

Signals System Stop output initiates a stop even when an E-stop is not triggered. You can use the following Safety functions output signals. All signals return to low when the state which triggered the high signal has ended:

<sup>1</sup> System Stop	Signal is <i>Low</i> when the safety system has been triggered into a stopped state including by the Robot Emergency Stop input or the Emergency Stop Button. To avoid deadlocks, if the Emergency Stopped state is triggered by the System Stop input, low signal will not be given.
Robot Moving	Signal is <i>Low</i> if the robot is moving, otherwise high.
Robot Not Stopping	Signal is <i>High</i> when the robot is stopped or in the process of stopping due to an emergency stop or safeguard stop. Otherwise it will be logic low.
Reduced	Signal is <i>Low</i> when reduced parameters are active or if the safety input is configured with a reduced input and the signal is currently low. Otherwise the signal is high.
Not Reduced	This is the inverse of Reduced, defined above.
Safe Home	Signal is <i>High</i> if the Robot Arm is stopped and is located in the configured Safe Home Position. Otherwise, the signal is <i>Low</i> . This is often used when UR robots are integrated with mobile robots.

#### NOTICE

Any external machinery receiving its Emergency Stop state from the robot through the System Stop output must comply with ISO 13850. This is particularly necessary in setups where the Robot Emergency Stop input is connected to an external Emergency Stop device. In such cases, the System Stop output becomes high when the external Emergency Stop device is released. This implies that the emergency stop state at the external machinery will be reset with no manual action needed from the robot's operator. Hence, to comply with safety standards, the external machinery must require manual action in order to resume.

<sup>&</sup>lt;sup>1</sup>System Stop was previously known as "System Emergency Stop" for Universal Robots robots. PolyScope can display "System Emergency Stop".

# 2.8. Software Safety Restrictions

Description

#### NOTICE

Configuring planes is entirely based on features. We recommend that you create and name all features before editing the safety configuration, as the robot is powered off once the Safety Tab has been unlocked, making it impossible to move the robot.

Safety planes restrict robot workspace. You can define up to eight safety planes, restricting the robot tool and elbow. You can also restrict elbow movement for each safety plane and disable it by deselecting the checkbox. Before configuring safety planes, you must define a feature in the robot installation. The feature can then be copied into the safety plane screen and configured.

#### WARNING

Defining safety planes only limits the defined Tool spheres and elbow, not the overall limit for the robot arm. This means that specifying a safety plane, does not guarantee that other parts of the robot arm will obey this restriction.

Safety You can configure each plane with restrictive **Modes** using the icons listed below.

Plane s

Mode

	Disabled	The safety plane is never active in this state.
	Normal	When the safety system is Normal , a normal plane is active and it acts as a strict limit on the position.
	Reduced	When the safety system is Reduced, a reduced plane is active, acting s as a strict limit on the position.
	Normal & Reduced	When the safety system is either normal or reduced, a normal and reduced plane is active and acts as a strict limit on the position.
Þ	Trigger Reduced	The safety plane causes the safety system to switch to Reduced if the robot Tool or Elbow is positioned beyond it.
0	Show	Pressing this icon hides or shows the safety plane in the graphics pane.
ŵ	Delete	Deletes the created safety plane. There is no undo/redo action. If a plane is deleted in error, it must be remade.
Ø	Rename	Pressing this icon allows you to rename the plane.

#### Configuring safety planes

- 1. In your PolyScope header, tap Installation.
- 2. In the Side Menu on the left of the screen, tap Safety and select Planes.
- 3. On the top right of the screen, in the Planes field, tap Add plane.
- 4. On the bottom right of the screen, in the **Properties** field, set up Name, Copy Feature and Restrictions.

CopyIn Copy Feature, only Undefined and Base are available. You can reset a configured safetyFeatureplane by selecting Undefined

If the copied feature is modified in the Features screen, a warning icon appears to the right of the Copy Feature text. This indicates that the feature is out of sync i.e. the information in the properties card is not updated to reflect the modifications that may have been made to the Feature.

Color
Codes

Gray	Plane is configured but disabled (A)
Yellow & Black	Normal Plane (B)
Blue & Green	Trigger Plane (C)
Black Arrow	The side of the plane the tool and/or elbow is allowed to be on (For Normal Planes)
Green Arrow	The side of the plane the tool and/or elbow is allowed to be on (For Trigger Planes)
Gray Arrow	The side of the plane the tool and/or elbow is allowed to be on (For Disabled Planes)

ElbowYou can enable Restrict Elbow to prevent robot elbow joint from passing through any of<br/>your defined planes. Disable Restrict Elbow for elbow to pass through planes.<br/>The diameter of the ball that restricts the elbow is different for each size of robot.

UR3e	0.1 m
UR5e	0.13 m
UR10e / UR16e	0.15 m
UR20 / UR30	0.19 m

The information about the specific radius can be found in the *urcontrol.conf* file on the robot under the section [Elbow].

Tool FlangeRestricting the tool flange prevents the tool flange and the attached tool from crossing a<br/>safety plane. When you restrict the tool flange, the unrestricted area is the area inside of<br/>the safety plane, where the tool flange can operate normally.<br/>The tool flange cannot cross the restricted area, outside of the safety plane.

Removing the restriction allows the tool flange to go beyond the safety plane, to the restricted area, while the attached tool remains inside of the safety plane.

You can remove the tool flange restriction when working with a large tool off-set. This will allow extra distance for the tool to move.

Restricting the tool flange requires the creation of a plane feature. The plane feature is used to set up a safety plane later in the safety settings.

Adding a plane feature example

Displacement offsets the plane in either the positive or negative direction along the plane normal (Z-axis of the plane feature).

Deselect the checkbox for the Elbow and the Tool Flange so they do not trigger the safety plane. The Elbow can remain checked as needed by your application.

The unrestricted tool flange can cross a safety plane, even when no tool is defined. If no tool is added, a warning on the Tool Position button prompts you to correctly define the tool.

When working with an unrestricted tool flange and a defined tool, it is ensured that the dangerous part of the tool can't go above and/or beyond certain area. The unrestricted tool flange can be used for any application where safety planes are needed, like Welding or Assembly.

Tool flange restriction example In this example, an X-Y-plane is created with an offset of 300mm along the positive Z-axis with reference to the base feature.

The Z-axis of the plane can be thought of as "pointing" towards the restricted area. If the safety plane is needed on e.g., the surface of a table, rotate the plane 3.142 rad or 180° around either the X- or Y-axis so the restricted area is under the table. (TIP: Change the display of rotation from "Rotation Vector [rad]" to "RPY [°]")

If needed it is possible to offset the plane in either positive or negative Z-direction later in the safety settings.

When satisfied with the position of the plane, tap OK.

### 2.8.1. Tool Direction Restriction

#### Description

The Tool Direction screen can be used to restrict the angle in which the tool is pointing. The limit is defined by a cone that has a fixed orientation with respect to the robot arm Base. As the robot arm moves around, tool direction is restricted so it remains within the defined cone. The default direction of the tool coincides with the Z-axis of the tool output flange. It can be customized by specifying tilt and pan angles.

Before configuring the limit, you must define a point or plane in the robot installation. The feature can then be copied and its Z axis used as the center of the cone defining the limit.

#### NOTICE

Configuration of the tool direction is based on features. We recommend you create desired feature(s) before editing the safety configuration, as once the Safety Tab has been unlocked, the robot arm powers off making it impossible to define new features.

**Limit** The Tool Direction limit has three configurable properties:

Prope rties

1. **Cone center**: You can select a point or plane feature from the drop-down menu, to define the center of the cone. The Z axis of the selected feature is used as the direction around which the cone is centred.

2. Cone angle: You can define how many degrees the robot is allowed to deviate from center.

Disabled Tool direction limit	Never active
Normal Tool direction limit	Active only when safety system is in Normal mode
Reduced Tool direction limit	Active only when the safety system is in Reduced mode
Normal & Reduced Tool	Active when the safety system is in Normal mode as
direction limit	well as when it is in <b>Reduced mode</b> .

You can reset the values to default or undo the Tool Direction configuration by setting the copy feature back to "Undefined".

ToolBy default, the tool points in the same direction as the Z axis of the tool output flange. This can bePropemodified by specifying two angles:

- rties
- Tilt angle: How much to tilt the Z axis of the output flange towards the X axis of the output flange
- Pan angle: How much to rotate the tilted Z axis around the original output flange Z axis.

Alternatively, the Z axis of an existing TCP can be copied by selecting that TCP from the drop-down menu.

### 2.8.2. Tool Position Restriction

Description

**ion** The Tool Position screen enables more controlled restriction of tools and/or accessories placed on the end of the robot arm.

- Robot is where you can visualize your modifications.
- Tool is where you can define and configure a tool up to two tools.
- **Tool\_1** is the default tool defined with values x=0.0, y= 0.0, z=0.0 and radius=0.0. These values represent the robot tool flange.

Under Copy TCP, you can also select **Tool Flange** and cause the tool values to go back to 0.

A default sphere is defined at the tool flange.

	Robot							Tool (1 of 3)
Safety								Tool Flange
Robot Limits								+ Add Tool
Joint Limits							+	
Planes								
• Tool Position								
Tool Direction								🦺 Remember to define a tool
I/O								Tool Flange
Hardware								<i>v</i> rearrange
PROFIsafe								Radius (max: 300mm)
Safe Home								0.0 mm
Three Position								Copy TCP
Features						[	_	Tool Flange
						l		Edit Position
Fieldbus								X 0.0 mm
• URCaps								Y 0.0 mm
								Z 0.0 mm
		Safety password	d	Unlo	ck I	Lock		App

User defined tools For the user defined tools, the user can change:

- **Radius** to change the radius of the tool sphere. The radius is considered when using safety planes. When a point in the sphere passes a reduced trigger plane, the robot switches to a Reduced configuration. The safety system prevents any point on the sphere from passing a safety plane.
- **Position** to change the position of the tool with respect to the tool flange of the robot. The position is considered for the safety functions for tool speed, tool force, stopping distance and safety planes.

You can use an existing Tool Center Point as a base for defining new tool positions. A copy of the existing TCP, predefined in General menu, in TCP screen, can be accessed in Tool Position menu, in Copy TCP drop-down list.

When you edit or adjust the values in the **Edit Position** input fields, the name of the TCP visible in the drop down menu changes to **custom**, indicating that there is a difference between the copied TCP and the actual limit input. The original TCP is still available in the drop down list and can be selected again to change the values back to the original position. The selection in the copy TCP drop down menu does not affect the tool name.

Once you apply your Tool Position screen changes, if you try to modify the copied TCP in the TCP configuration screen, a warning icon appears to the right of the Copy TCP text. This indicates that the TCP is out of sync i.e. the information in the properties field is not updated to reflect modifications that may have been made to the TCP. The TCP can be synced by pressing the sync icon.

The TCP does not have to be synced in order to define and use a tool successfully. You can rename the tool by pressing the pencil tab next to the displayed tool name. You can also determine the Radius with an allowed range of 0-300 mm. The limit appears in the graphics pane as either a point or a sphere depending on radius size.

	Hove	<u>چ</u>	<b>≁</b>			∣ <unnamed>* ∣ default_1*</unnamed>	New	Open	Save

Tool PositionYou must set a Tool Position within the safety settings, for the safety plane to triggerWarningcorrectly when the tool TCP approaches the safety plane.<br/>The warning remains on the Tool Position if:

• You fail to add a new tool under Tool Flange.

To configure the tool position

- 1. In the Header tap Installation.
- 2. On the left side of the screen, under Safety, tap Tool Position.
- 3. On the right side of the screen, select Add Tool.
  - The newly added tool has a default name: Tool\_x.
- 4. Tap the edit button to rename **Tool\_x** to something more identifiable.
- 5. Edit the Radius and Position to match that of the tool you are currently using, or use the Copy TCP drop-down and choose a TCP from the General>TCP settings if such is defined.

Tool PositionInWarningmexamplem

In this example, a Radius of 0.8mm is set and the TCP position to XYZ [20, 0, 400] in millimeters respectively. Optionally you can choose to "Copy TCP" by using the drop-down menu if one has already been set in the ->General/TCP settings. Once the Apply is tapped in the bottom right corner of the screen, you are DONE.

The warning on the Tool Position button indicates a tool is not added under Tool Flange.

Tool Position button without the warning indicates a tool (other than the Tool Flange) is added.

### 2.9. Safe Home Position

Description

Safe Home is a return position defined by using the user-defined Home Position.

Safe Home I/Os are active when the Robot Arm is in the Safe Home Position and a Safe Home I/O is defined.

The Robot Arm is in the Safe Home Position if the joint positions are at the specified joint angles or a multiple of 360 degrees thereof.

The Safe Home Safety Output is active when the robot is standing still at the Safe Home Position.

Syncing from Home	<ol> <li>To sync from Home</li> <li>In the Header, tap Installation.</li> <li>In the Side Menu on the left of the screen, tap Safety and select Safe Home.</li> <li>Under Safe Home, tap Sync from Home.</li> <li>Tap Apply and in the dialog box that appears, select Apply and restart.</li> </ol>
Safe Home Output	The Safe Home Position must be defined before the Safe Home Output.
Defining Safe Home Output	<ol> <li>To define Safe Home Output</li> <li>In the Header, tap Installation.</li> <li>In the Side Menu on the left of the screen, under Safety, select I/O.</li> <li>On the I/O screen in the Output Signal, under Function Assignment, in drop-down menu, select Safe Home.</li> </ol>

4. Tap Apply and in the dialog box that appears, select Apply and restart.

#### Editing Safe To edit Safe Home

**Home** Editing Home does not automatically modify a previously defined Safe Home position. While these values are out of sync, Home program node is undefined.

- 1. In the Header, tap Installation.
- 2. In the Side Menu on the left of the screen, under General, select Home.
- 3. Tap Edit Position and set the new robot arm position and tap OK.
- 4. In the Side Menu, under **Safety**, select **Safe Home**. You need a Safety password to **Unlock** the Safety Settings.
- 5. Under Safe Home, tap Sync from Home

# 3. Run Tab

#### Description

The **Run** tab allows you to do simple operations and monitor the state of your robot. You can load, play, pause and stop a program, as well as monitor variables. The Run Tab is most useful when the program is created and the robot is ready for operation.

ues during runtime.

- Program variables belong to programs.
- Installation variables belong to installations that can be shared among different programs. The same installation can be used with multiple programs.

All program variables and installation variables in your program are displayed in the Variables pane as a list showing the Name, Value and Description of the variable.

Variable descriptions	You can add information to your variables by adding variable descriptions in the Description column. You can use the variable descriptions to convey the purpose of the variable and/or the meaning of its value to operators using the Run tab screen and/or other programmers. Variable descriptions (if used) can be up to 120 characters, displayed in the Description column of the variables list on the Run tab screen and the Variables tab screen.				
Favorite variables	<ul> <li>You can display selected variables by using the Show only favorite variables option. To show favorite variables</li> <li>1. Under Variables, check the Show only favorite variables box.</li> <li>2. Check Show only favorite variables again to show all variables.</li> <li>You cannot designate favorite variables in the Run Tab, you can only display them. Designating favorite variables depends on the variable type.</li> </ul>				
To designate favorite program variables	<ol> <li>In the Header, tap Program. The variables are listed under Variable Setup.</li> <li>Select the desired variables.</li> <li>Check the Favorite variable box.</li> <li>Tap Run to return to your variable display.</li> </ol>				
To designate favorite installation variables	<ol> <li>In the Header, tap Installation.</li> <li>Under General, select Variables. The variables are listed under Installation Variables.</li> <li>Select the desired variables.</li> <li>Check the Favorite variable box.</li> <li>Tap Run to return to your variable display.</li> </ol>				
Collapse/expand the Description column	A variable description spans multiple lines to fit the width of the Description column if necessary. You can also collapse and expand the Description column by using the buttons shown below. To collapse/expand the Description column 1. Tap to collapse the Description column. 2. Tap to expand the Description column. here				

**Control** The Control pane allows you to control the running program. You can play and stop, or pause and resume a program, using the buttons listed in the table below:

- The Play button, Pause button and the Resume Button are combined.
- The Play button changes to Pause when the program is running.
- The Pause button changes to Resume.

Button		Function
Play		To play a program 1. Under Control, tap <b>Play</b> to start running a program from the beginning.
Resume		To resume a paused program 1. Tap <b>Resume</b> to continue running the paused program.
Stop	0	To stop a program <ol> <li>Tap Stop to stop the running program</li> <li>You cannot resume a stopped program.</li> <li>You can tap Play to restart the program.</li> </ol>
Pause		<ul> <li>To pause a program</li> <li>1. Tap Pause to pause a program at a specific point.</li> <li>You can resume a paused program.</li> </ul>

# 3.1. Move Robot into Position

Description	Access the <b>Move Robot into Position</b> screen when the Robot Arm must move to a particular start position before running a program, or when the Robot Arm is moving to a waypoint while modifying a program.					
	In cases where the <b>Move Robot into Position</b> screen cannnot move the Robot Arm to the program start position, it moves to the first waypoint in the program tree. The Robot Arm can move to an incorrect pose if:					
	<ul> <li>The TCP, feature pose or waypoint pose of the first movement is altered during program execution before the first move is executed.</li> </ul>					
	The first waypoint is inside an If or Switch program tree node.					
Accessing the Move Robot into Position	<ol> <li>Tap the Run tab in the header.</li> <li>In the Footer, tap Play to access the Move Robot into Position screen.</li> </ol>					
Screen	3. Follow the on-screen instructions to interact with the animation and the real robot.					
Move robot to	Hold down <b>Move robot to:</b> to move the Robot Arm to a start position. The animated Robot Arm displayed on-screen shows the desired movement about to be performed.					
	NOTICE					
	Collision can damage the robot or other equipment. Compare the animation with the position of the real Robot Arm to ensure the Robot Arm can safely perform the movement without colliding with any obstacles.					
Manual	Tap <b>Manual</b> to access the <b>Move</b> screen where the Robot Arm can be moved by using the Move Tool arrows and/or configuring Tool Position and Joint Position coordinates.					

# 3.2. Program

#### Description

The **Program** field, displays the name of the program that was loaded on to the robot and its current status. You can tap the **Load Program** tab to load a different program.

# 3.3. Variables

#### Description

A robot program can make use of variables to store and update values during runtime. The variables in the table below are available:

Installation variables	These can be used by multiple programs and their names and values are persisted together with the robot installation. Installation variables keep their value after the robot and control box has been rebooted.
Regular program variables	These are available to the running program only and their values are lost as soon as the program is stopped.

Show waypoints allows the robot program to use script variables to store information about waypoints. You can select the Show Waypoints checkbox, under Variables to show script variables in the variables list.

Available					
Output	bool	A boolean variable whose value is either True or False.			
Actions	int	A whole number in the range from - 2147483648 to 2147483647 (32 bit).			
	float	A floating point number (decimal) (32 bit).			
	string	A sequence of characters.			
	pose	A vector describing the location and orientation in Cartesian space. It is a combination of a position vector ( <i>x</i> , <i>y</i> , <i>z</i> ) and a rotation vector ( <i>rx</i> , <i>ry</i> , <i>rz</i> ) representing the orientation, written p [x, y, z, rx, ry, rz].			
	list	A sequence of variables.			

# 4. Program Tab

#### Description

The Program tab is the where you create and edit robot programs. There are two main areas:

- The left side contains the program nodes you can add to your robot program. You can use the Basic, Advanced and Template dropdowns to the very left.
- The right side contains the configuration of the program nodes you can add to your program.

You can use Command, Graphics and Variables options.

#### **Program Tree** The program tree is built as you add program nodes to your program. You can use the Command tab to configure the functionality of the added program nodes.

Run Program Installation			RAM StartABCDE	Open Save	
<b>&gt;</b> Basic		Q Comr	nand Graphics	Variables

### 4.1. Robot Program Configuration

#### Description

Use the Robot Program Configuration to create a configuration for the entire robot program.

While this type of configuration does not affect individual program nodes, it affects the entire robot program.

You can, for example do the following:

- · Add instructions to be executed before the robot program is started.
- Set an initial variable value for the program start.
- Make the program loop forever.

Add Before Start Sequence	Select this checkbox to add instructions or program nodes that are executed before the main program starts. These nodes are only executed once even though the robot program is set to loop forever.
Program Loops Forever	Select this checkbox to allow the program to start again when it reaches the end of the program.
Example	You can initialize grippers, move the robot to a "home" position, or reset signals to and from external sources.

Set Initial Variable Value Select this to set initial values of program variables.

- 1. Select a variable from the drop down list, or use the variable selector box.
- 2. Enter an expression for that variable. This expression is used to set the variable value at program start.
- 3. You can select **Keep value f rom previous run** to initialize the variable to the value found on the **Variables** tab (see 4.2.4 Variables Tab on page 76). This allows variables to maintain their values between program executions. The variable gets its value from the expression if the program is run for the first time, or if the value tab has been cleared.

A variable can be deleted from the program by setting its name to blank (only spaces).

### 4.2. Program Tree Toolbar

Description

You can work with the program nodes that have been added to the program tree by using the icons in the bottom of the program tree.

lcons in the Program Tree toolbar Use the toolbar at the base of the Program Tree to modify the Program Tree.

Undo & Redo	◆ ペ	undo and redo changes to commands.
Move Up & Move Down	▲ & ↓	changes the position of a node.
Cut	×	cuts a node and allows it to be used for other actions (e.g., paste it on other place on the Program Tree).
Сору		copies a node and allows it to be used for other actions (e.g., paste it on other place on the Program Tree).
Paste	F	pastes a node that was previously cut or copied.
Delete	Î	removes a node from the Program Tree.
Suppress	()	suppresses specific nodes on the Program Tree.
Search Button	۹	search in the Program Tree. Tap the icon to exit search.

### 4.2.1. Variable Setup

#### Description

The Variable Setup is always the first node on the program tree.

The Variable Setup pane is where you name and edit program variables, and designate them as favorites.

Designating a favorite variable displays it on the Variable pane in the Program tab screen and on the Run tab screen.

To designate a program variable as favorite	<ol> <li>In the Header, tap Program.</li> <li>Under Variables Setup, select a variable.</li> <li>Check the Favorite variable box to designate the selected variable as favorite.</li> </ol>			
Editing program variables	Editing program variables includes naming, describing and setting an expression.			
To name a program variable	<ol> <li>Under Variables Setup, select a variable.</li> <li>Select the Name field.</li> <li>Type a name using the on-screen keyboard that appears.</li> </ol>			
To describe a program variable	<ol> <li>Under Variables Setup, select a variable.</li> <li>Select the <b>Description</b> field.</li> <li>Type a description using the on-screen keyboard that appears.</li> </ol>			

To set an expression program variable	<ol> <li>Under Variables Setup, select a variable.</li> <li>Select the Expression field.</li> <li>Type the expression using the on-screen keyboard that appears.</li> </ol>					
Initial value	An initial value is the first value you assign to a program variable, when you start a prograving You can check the <b>Keep value from previous run</b> box to replace the initial value with a value from a previously run program. However, if you load a new program, after using a value from a previously run program, the initial value is reinstated.					

### 4.2.2. Command Tab

 Description
 The Command tab contains the configuration options for the selected program node.

 These configuration options appear under the Command Tab on the right side of the screen.
 The Command tab's pane changes when you select each different program node, on the left side of the screen.

Examples of different commands are given below.

Move

The Move command is one of the most often used commands in PolyScope. Here you can see a MoveJ command is selected. Other information such as TCP, joint speed and joint acceleration is visible.

🛛 Universal Robots Graphical Programming Environment 💷 🕞												
Run Program Installation			PROGRAM <b><unna< b=""> INSTALLATION <b>default</b></unna<></b>		New		1 Ne	CCC0 CCC0				
✔ Basic		Q	Command	Grapi	hics	Variable	s					
Move	1 <b>V</b> Robot Program		Move				Mov		•			
Waypoint	2 P 🕂 Movel			obot will	bot will move between				•			
Direction	3 - O Waypoint_1		The values below apply to all child waypoints and depend on the selected movement									
Wait		type.										
Set		Set TCP		Joint Speed								
Popup		Use active TCP				60.0 °/s						
Halt			Feature				loint Accelerat	ion				
Comment			Base				80.0 °/s²					
Folder			IF									
Set Payload												
> Advanced			Use joint angle	es								
<b>&gt;</b> Templates												
							Re	set				
	▲ ♣ つ ぐ 器 直 直 面											
Normal		_			•		$\mathbf{D}$	Simulation				
$\mathbf{\nabla}$			Speed 100	)%								

#### Example

The Move command controls the robot's motion via waypoints. You can also use Move to set acceleration and speed for the robot arm's movement between waypoints.

# Wait You can use the Wait command to make the robot program wait for a signal from a sensor that is attached to the control box.

#### Palletizing

You can use the palletizing template to quickly create a palletizing program. The same palletizing program is also used to create a depalletizing program.

R Universal Robots Graphical Programming Environment _ 🛛 ×										
			PROGRAM <b><unna< b=""> INSTALLATION <b>defaul</b>t</unna<></b>		New	Open Save

O Normal			Speed 10	)%		- C				
_			00000 201							

lf

Allows you the option to add "If", "Else" and "Elself" conditions to a robot program.

#### Example

You can use the If command to create two different results for a robot program.

## 4.2.3. Graphics Tab

#### Description

The Graphics tab provides a graphical representation of the running program. The buttons in the top-right side of the Graphics tab pane can disable the graphics in 3D view.

The 3D drawing of the robot arm shows the current position of the robot arm. The shadow of the robot arm shows the robot arm's intended path to reach the waypoint selected in the left hand side of the screen.

The path of the TCP is shown in 3D view as follows:

• The motion segments are black.

plane the TCP is allowed to be positioned.

- The blend segments (transitions between motion segments) are green.
- The green dots specify the positions of the TCP at each of the waypoints in the program.

Planes	A plane is a boundary that limits the movement of the TCP. A plane can also limit the movement of a tool. A 3D representation of the plane appears in the pane when the TCP, or tool, comes close to a plane.				
	<ul> <li>You can zoom in to the 3D view to get a better view of the robot arm, TCP or tool.</li> <li>You can use two types planes to limit TCP and tool movement.</li> </ul>				
Safety	Safety planes appear in the 3D view in yellow and black. An arrow indicates which side of the				

Planes

### Trigger Trigger planes appear in the 3D view in blue and green. A small arrow points to the side of Planes the plane, where the Normal mode limits (see 2.5 Software Safety Modes on page 34) are active. The tool orientation boundary limit is visualized with a spherical cone together with a vector indicating the current orientation of the robot tool. The inside of the cone represents the allowed area for the tool orientation (vector). Limits When a program is running, the 3D view of boundary limits are disabled. When the TCP is no longer close to any limit, the 3D view disappears. You can set tool orientation boundary limits that appear in the 3D view as a spherical cone together with a vector indicating the current orientation of the robot tool. The inside of the cone represents the allowed area for the tool orientation (vector). • You can also set red limits that appear red in the 3D view when the TCP is in violation, or very close to violating a boundary limit.

## 4.2.4. Variables Tab

Description	The Variables tab in the Program Tab shows the live values of variables in the running program. The variables appear as a list in the pane under the Variables tab on the right side of the screen. Variables only appear when there is information to display and remain visible between program runs.
Show Waypoints	You can check the Show Waypoints box to display the waypoint variables in the running program. In the Variables pane, you can also use the following options: • Select <b>Show Waypoints</b> to show waypoint script variables in the variables list. The

- robot program uses script variables to store information about waypoints. Select the Show Waypoints checkbox, under Variables to show script variables in the variables list.
- Select **Show only favorite variables** to only view favorite variables on the Variables Tab. This is the same as in the Variables pane on the Run Tab (See 3 Run Tab on page 57).

VariableA robot program uses variables to store and update various values during runtime.Value TypesVariables only appear when there is information to display. Variable types include:

- Program variables These are available to the running program only and their values are lost as soon as the program is stopped.
- Installation variables These can be used by multiple programs and their names and values stay together with the robot installation (see 5.5 Installation Variables on page 181).
- Script variables These come from script files and they can be assigned different variable types. Script variables do not appear in the Program tab or in the Installation tab. The robot program uses the script variables to store information about waypoints. You can select the Show Waypoints checkbox, under Variables, to show script variables in the variables list.

The table below list variable value types:

bool	A boolean variable whose value is either True or False		
int	A whole number in the range from -2147483648 to 2147483647 (32 bit)		
float	A floating point number (decimal) (32 bit)		
string	A sequence of characters		
pose	A vector describing the location and orientation in Cartesian space. It is a combination of a position vector $(x, y, z)$ and a rotation vector $(rx, ry, rz)$ representing the orientation written $p[x, y, z, rx, ry, rz]$		
list	A sequence of variables		

# 4.3. Expression Editor

Description

The expression editor has a number of buttons and functions for inserting the special expression symbols, such as \* for multiplication and  $\leq$  for less than or equal to. Expressions are edited as text.

All defined variables can be found in the Variable selector, while the names of the input and output ports can be found in the Input and Output selectors. Some special functions are found in Function.

Expressions inWhen your expression is complete, you can tap the Submit button to check forEditorgrammatical errors. The Esc button exits the screen and discards all unsaved changes.

## Example

#### digital\_in[1] <u>?</u>

True and analog in[0]<0.5

# 4.4. Using a Selected Program Node

**Description** You can start your robot program from any program node in the program tree. This is useful when you are testing your program.

When the robot is in Manual Mode you can allow a program to start from a selected node or you can start the entire program from the beginning.

Play FromThe Play button in the Footer provides options for how to start the program.SelectionIn the image below, the Play button is selected and Play from Selection is displayed.

A Basic	Command			
		Graphics	Variables	
Move     1     X     Variables     Setup       Waypoint     2     V     Robot     Program       Direction     3     9     Move/ 4     Owypoint_1       Wait     4     Owypoint_1			Movej etween waypoints. waypoints and depend on the selected move	▼ ment
Set Popup Halt Comment Folder Set Payload Advanced	Position Feature Base Set TCP Use active TCP Use joint ang	les	Joint Acceleration	▼ 50 °/s 30 °/s²
▲ チ ゥ ぐ X 単 首 面 〓 Power off			Play from beginning Robot Program Play from selection 3: Movej Simulation	

• You can start a program only from a node in the robot Program tree. The **Play from Selection** stops if a program cannot be run from a selected node.

The program also stops and displays an error message if an unassigned variable in encountered while playing a program from selected node.

- You can use **Play from Selection** in a subprogram. The program execution halts when the subprogram ends.
- You cannot use **Play from Selection** with a thread because threads always start from the beginning.

To play a program from a selected node

- 1. In the Program tree, select a node.
- 2. In the Footer, tap Play.
- 3. Select **Play from Selection** to run a program from a node in the program tree.

**Example** You can start a stopped program again from a specific node.

# 4.5. Using Breakpoints in a Program

Description

A breakpoint pauses program execution. You can use breakpoints to pause and resume a running program at a specific point. This is useful when you are inspecting robot position, variables, etc. (See Operational mode on page 26). The image below shows a breakpoint added to a node.

# **Breakpoints** When the robot program reaches a breakpoint, it turns red. The following breakpoints remain blue.

asic		Q Command Graphics	s Variables	
Move	1 X Variables Setup	Waypoint		Fixed position
Waypoint	2 🔻 Robot Program	waypoint		Tixed position
Direction	3 ♥ 🕂 Movej 4 — ⊙ A	В	<b>Q</b> 0	
Wait	• O B	C - + 14	/aypoint	
Set	6 O C	Set v	vaypoint	ビビ
Popup	7 O D 8 O E		t pose	· ·
Halt		Edi	pose	
Comment				Move here
Folder		Þ		hove here
Set Payload		-	r	
dvanced		Stop at this point		Shared parameters
emplates		O Blend with radius		oint Speed
		0 mm		60 °
				oint Acceleration
				80 °

The breakpoint appears as a red line either above or below a node. The red line appears below waypoint nodes and above all other nodes.

Most nodes in program pause before they are executed. Adding a breakpoint changes the behavior of the nodes.

- You can add a breakpoint to a waypoint to allow the program to pause at this waypoint. This means the blend in the node is ignored.
- You can add a breakpoint to an Until node to allow the program to pause when the Until condition is met. This means the blend in the node is not ignored.

Add a Breakpoint To add a breakpoint to a program

- 1. In a Program tree, tap a line number to add a breakpoint.
- 2. The breakpoint is active until you clear the breakpoint from the robot program.

Clear a Breakpoint

- To clear a breakpoint in a program
  - 1. In a Program tree, tap a breakpoint to remove it again.
  - 2. The robot program will run as intended.

# 4.6. Single Step in a Program

# Description Single Step allows the current program to be exectued one node at a time, when the robot is in Manual mode. (See Operational mode on page 26). This is useful when you are checking your program for errors. Single Step Single Step allows the selected program node to run, then pauses at the beginning of a new node. Single Step can only be used when the current program is paused. If you want to use Single Step on a specific node, the node must also support Breakpoints.

# 4.7. Basic program nodes

Description	Basic program nodes are used to create simple robot applications. Some basic program nodes are also used to organize your robot program and create comments in your robot program. This can be quite useful, if it is large robot program.
4.7.1. Move	
Description	The Move command allows the robot to move from point A to point B. How the robot moves is important to the task the robot is performing. When you add a Move to your program tree, the Move pane appears to the right of the screen. The options in the Move pane allow you to configure a Move and the attached waypoint.

14.1: Speed profile for a motion. The curve is divided into three segments: acceleration, cruise and deceleration. The level of the cruise phase is given by the speed setting of the motion, while the steepness of the acceleration and deceleration phases is given by the acceleration parameter.

OptiMove is a motion control option that specifies the speed and acceleration of the robot, while maintaining hardware limits. This means the optimal motion of the robot does not exceed the desired limits.

So 100% is the maximum speed percentage and acceleration within the hardware limits.

	The Move command controls the robot's motion via waypoints. Waypoints are automatically added when you add Move commands to a program. You can also use Moves to set acceleration and speed for the robot arm's movement between waypoints.
	The robot moves using four Move commands as described in the following sections:
	MoveJ below
	MoveL on the next page
	MoveP on the next page
	MoveCircle on page 89
MoveJ	The MoveJ command creates a movement from point A to point B that is optimal for the robot. The movement may not be a direct line between A and B, but optimal for the start position of the joints and the end position of the joints. MoveJ makes movements that are calculated in the robot arm joint space. Joints are controlled to finish their movements at the same time. This movement type results in a curved path for the tool to follow.
To add a	1. In your robot program tree, select the place where you wish to add a Move.
MoveJ	2. Under Basic, tap <b>Move</b> to add a Move node together with a waypoint.
	3. Select the move node.
	4. Select MoveJ in the drop-down menu.

To add a	1. In your robot program tree, select the desired move node or waypoint node.
MoveJ with	2. In the Motion Controls dropdown menu, select <b>OptiMove</b> .
OptiMove	3. Use the slider to set the speed.
	4. You can select Scaled acceleration to keep the settings linked.
	You can deselect <b>Scaled acceleration</b> to modify the settings independently.
Using Use	The Use joint angles option is an alternative to the 3D pose when you are using MoveJ to
joint angles	s define a waypoint.
	Waypoints defined using the Use joint angle are not changed when a program is moved
	between robots. This is useful if you are installing your program in a new robot.
	Using Use joint angles makes the TCP options and feature unavailable.
MoveL	The MoveL command creates a movement that is a direct line from point A and point B. MoveL
	moves the Tool Center Point (TCP) linearly between waypoints. This means that each joint
	performs a more complicated motion to keep the tool on a straight line path.
To add a	Adding a MoveL is similar to adding a MoveJ.
MoveL	1. In your robot program tree, select the place where you wish to add the MoveL.
	2. Under Basic, tap Move and select MoveL from the drop-down menu.
	Adding a MoveL with OptiMove is also similar to adding a MoveJ with OptiMove.
	Once you select the node, simply navigate to the Motion Controls dropdown and select
	OptiMove.

**MoveP** The MoveP command creates a movement with a constant speed between the waypoints. Blend between waypoints is enabled to ensure constant speed. To add a Adding a MoveP is similar to adding a MoveJ and a MoveL.

- MoveP
- 1. In your robot program tree, select the place where you wish to add the MoveP.
- 2. Under Basic, tap Move and select MoveP from the drop-down menu.

Adding a MoveP with OptiMove is also similar to adding a MoveJ with OptiMove. Once you select the node, simply navigate to the Motion Controls dropdown and select OptiMove.

Detail MoveP moves the tool linearly with constant speed with circular blends, and is intended for some process operations, like gluing or dispensing. The size of the blend radius is by default a shared value between all the waypoints. A smaller value will make the path turn sharper whereas a higher value will make the path smoother. While the robot arm is moving through the waypoints with constant speed, the robot control box cannot wait for either an I/O operation or an operator action. Doing so might stop the robot arm's motion, or cause a robot stop.

**MoveCircle** The MoveCircle command creates a circular movement, by creating a half circle. You can only add CircleMove via a MoveP command.

To add a MoveCircle

- 1. In your robot program tree, select the place where you wish to add a Move.
- 2. Under Basic, tap Move.

A waypoint is added to the robot program together with the Move node.

- 3. Select the move node.
- 4. Select the MoveP from the drop-down menu.
- 5. Tap Add circle move
- 6. Select the orientation mode.

Detail The robot starts the circular movement from its current position, or start point, and moves through a ViaPoint specified on the circular arc, to an EndPoint that completes the circular movement.

A mode is used to calculate tool orientation, through the circular arc. The mode can be:

- Fixed: only the start point is used to define the tool orientation.
- Unconstrained: the start point transforms to the EndPoint to define tool orientation.

Using Set TCP

Set Use this setting, if you need to change TCP during the robot program execution. This is useful if you need to manipulate different objects in the robot program.
 The way the robot moves is adjusted depending on which TCP is set as an active TCP.
 Ignore Active TCP allows this movement to be adjusted in relation to the Tool Flange.

To set the	1. Access the Program Tab screen to set the TCP used for waypoints.					
TCP in a	2. Under Command, in the drop down menu on the right select the Move type.					
Move	3. Under Move, select an option in the Set TCP drop down menu.					
	<ol> <li>Select Use active TCP or select a user defined TCP. You can also choose Ignore Active TCP.</li> </ol>					
Feature	You can use Feature between waypoints for the program to remember the tool coordinates. This is useful when you are setting the waypoints (see 5.14 Features on page 192).					
	You can use Feature in the following circumstances:					
	<ul> <li>Feature has no effect on relative waypoints. The relative movement is always performed with respect to orientation of the Base.</li> </ul>					
	<ul> <li>When the robot arm moves to a variable waypoint, the Tool Center Point (TCP) is calculated as the coordinates of the variable in the space of the selected feature. Therefore, the robot arm movement for a variable waypoint changes if another feature is selected.</li> </ul>					
	<ul> <li>You can change a feature's position while the program is running by assigning a pose to its corresponding variable.</li> </ul>					

R

**UNIVERSAL ROBOTS** 

Shared Parameters in a Move Command

The shared parameters in the bottom right corner of the Move screen apply to the movement from the previous position of the robot arm to the first waypoint under the command, and from there to each of the following waypoints. The Move command settings do not apply to the path going *from* the last waypoint under that Move command.

## 4.7.2. Waypoints

Description Waypoints are one of the most central parts of a robot program, telling the robot arm where to go one movement at a time. See the following sections about using a waypoint: Fixed Waypoint on page 97 Relative Waypoint on page 100 Variable Waypoint on page 102 Configuring Waypoints on page 94 Set Fixed Waypoint on page 98 ٠ Blending on page 103 Add Until on page 110 Add Waypoints A waypoint accompanies a Move, so adding a Move is required for the first waypoint. 1. In your Robot Program, select the place where you wish to add a Move. Add a waypoint to a 2. Under Basic, tap Move. robot program A waypoint is added to the robot program together with the Move node. The additional waypoint is added under the waypoint that you selected in the robot program.

**Detail** Using a waypoint means applying the taught relationship between the feature and the TCP from the Move command. The relationship between the feature and the TCP, applied to the current selected feature, achieves the desired TCP location. The robot calculates how to position the arm to allow the current active TCP to reach the desired TCP position.

## **Configuring Waypoints**

Description	Waypoints can be configured in different ways depending on the setup, application and position of the waypoint in the robot program.				
	<ul> <li>Naming Waypoints below</li> <li>Linking Waypoints on the facing page</li> </ul>				
	<ul> <li>Linking Waypoints on the facing page</li> <li>Step at this point on the facing page</li> </ul>				
	<ul> <li>Stop at this point on the facing page</li> <li>Bland with radius on the facing page</li> </ul>				
	Blend with radius on the facing page				
	Use Shared Parameters on the facing page				
	<ul> <li>Joint Speed / Acceleration on page 96</li> <li>Time on page 96</li> </ul>				
	<ul><li>Time on page 96</li><li>Add Until on page 96</li></ul>				
Naming Waypoints	Waypoints automatically get a unique name when you add them to the robot program. The user can change the name of a waypoint.				
To name a waypoint	<ol> <li>Make sure you are positioned on the Command tab on the right side of the screen</li> <li>Select the waypoint you wish to rename</li> <li>Tap the Rename button</li> <li>Type the new name</li> <li>Tap Submit to save the new name</li> </ol>

Тір	In a large robot program, you can often have more than 50 waypoints, so create a naming rule that makes sense to you.						
Linking Waypoints	By selecting the link icon, waypoints are linked and share position information.						
Detail	Other waypoint information such as blend radius, tool/joint speed and tool/joint acceleration is configured for individual waypoints even though they may be linked.						
Stop at this point	You configure the robot program to stop at this waypoint. The robot will decelerate moving towards this point and continue to the next waypoint.						
Use Stop	1. Select the waypoint you wish to modify						
at this point	2. On the right side of the screen, select O Stop at this point						
Тір	This is useful to make the robot move to an exact position.						
Use case	When you wish to move the robot away from a welding or machine tending application.						
Blend with radius	You can add a blend radius for blending the robot arm's movement between waypoints. <u>See</u> this link for an in-depth description of blending.						
Use Blend with radius	When you add a blend to a waypoint, the transition between waypoints becomes more fluid and efficient. This will make the robot arm move more smoothly, but it is not applicable in every robot arm movement.						
	1. Select the waypoint you wish to modify						
	2. On the right side of the screen, select OBlend with radius						
	3. Add a number [mm] to define the blend radius						
	4. Tap <b>Submit</b> to save the number						
Тір	If you are using multiple waypoints to guide the transition between two points you can blend the waypoints in between to make the overall movement smoother and more efficient.						
Use Shared Parameters	This is the default setting for the waypoint. The settings are copied from the parent Move command.						
Use case	This is used when the joint speed and joint acceleration is NOT changed in the parent Move command.						

Joint Speed / Acceleration	You can modify the speed and acceleration of joints for each waypoint in a Move command.					
Modify joint speed or acceleration	<ol> <li>Select the waypoint you wish to modify</li> <li>On the right side of the screen, set the joint speed or acceleration by selecting         Joint Speed     </li> </ol>					
	Joint Acceleration					
	<ol> <li>Add the value for speed</li> <li>Add the value for acceleration</li> </ol>					
Use case	If you create a palletizing program, then you can make the waypoint move more slowly as the program places the objects, and move faster when moving to pick up another object.					
Time	You can change the amount of time that it takes to reach this waypoint. The maximum is 21.600 seconds/6 hour.					
Add time in seconds	<ol> <li>Select the waypoint you wish to modify</li> <li>On the right side of the screen, select Time</li> <li>Add a number in [s]</li> <li>Tap Submit to save the number</li> <li>It now takes [s] to move the robot arm to this waypoint.</li> </ol>

## **Fixed Waypoint**

Description	A fixed waypoint is the standard waypoint used in PolyScope. It is a fixed location, relative to a set coordinate system (the robot's base by default), that the robot will move back to when prompted. A fixed position waypoint is taught by physically moving the robot arm to the position. You can move the robot with the 1.4 Freedrive on page 12 or with the 6 Move Tab on page 207 in PolyScope.
	When to use:
	<ul> <li>If the robot must move to a specific location (to move around equipment or move to a specific location for operation like picking or placing).</li> </ul>
	<ul> <li>When you create an entire robot program using fixed waypoints relative to a location, i.e. relative to the robot base. You can move the robot, and redefine the location of base of the robot, then the robot program will work on the new location.</li> </ul>
	When NOT to use:
	<ul> <li>When you want the location of the waypoint to be dynamic. Fixed waypoints are static positions and only change when purposely updated or when they're relative to a coordinate system.</li> </ul>
Fixed	You can add a fixed waypoint to your robot program, when you add a Move command.

Copyright © 2009-2025 by Universal Robots A/S. All rights reserved.

Waypoint

There is no difference, if the Move command is a MoveJ, a MoveL or a MoveP.

To add a fixed waypoint to a robot program

- 1. In the Program tab, tap Basic.
- 2. Add a move command
- 3. Select the automatically generated waypoint

Example

When you are removing a work piece from a chuck in a machine tending application, make the waypoint a fixed position to avoid any contact with equipment.<sup>1</sup>

## Set Fixed Waypoint

**Description** Setting a fixed waypoint means that you move the robot arm to the position of the specific waypoint that you want to set. Then the waypoint is "set" in the robot program as a position in the overall movement of the robot arm.

You can use the freedrive mode, or you can move the robot arm with the manual controls in the Move tab. See: 4.7.1 Move on page 85

<sup>&</sup>lt;sup>1</sup>In machine tending, the chuck holds the tool performing work on a workpiece. For example, the chuck is the part of a drill that attaches to the drill bit.

#### Setting a Fixed Waypoint

To add a fixed waypoint to a robot program

- 1. In your Robot Program, select the place or node where you wish to add a fixed waypoint.
- 2. Under Basic, tap Waypoint.
- 3. Select your newly added waypoint in the robot program.

4. Tap

How you move the robot arm to set the waypoint depends very much on your robot program, the application what you are creating, the TCP configuration, etc. There is no one best way to set the waypoint.

- If you want to move the robot arm so that the TCP moves linearly, use the TCP arrows.
- If you want to move the robot arm with Freedrive, hold the Freedrive button.
- If you know the exact coordinate location for the next waypoint, then you can use the tool position to move the robot arm.
- · If you want to move a specific joint, use the Joint Position values

## **Relative Waypoint**

Description	A relative waypoint is created by defining two waypoints. These two waypoints determine the distance and direction the relative waypoint should move The relative waypoint can be defined to the robot arm's previous position, such as "two centimeters to the left". The second waypoint is dependent on the first. This waypoint can be created when adding the relative waypoint. It can also be a previously defined waypoint, such as a fixed waypoint.							
	When to use:							
	<ul> <li>When using a BeforeStart to move the robot straight up from any position. For example, if the robots is stopped in a position near parts.</li> </ul>							
	<ul> <li>If the first waypoint is relative and you press play. You don't need to move the robot into position to start the program.</li> </ul>							
	<ul> <li>When using SubPrograms to make repeatable movements at different locations around the robot. For example, screwdriving at multiple locations: move down 50mm, turn screwdriver on/off, move up 50mm.</li> </ul>							
	When not to use:							
	When a specific location must be reached repeatably.							
	When a constant path is desired.							
Example:	To move the robot 20 mm along the z-axis of the tool:							
Add relative waypoint	var_1=p[0,0,0.02,0,0,0] Movel							
	Waypoint 1 (relative position):							

Use variable=var\_1, Feature=Tool

Add a relative waypoint to a robot program

- 1. In the Program tab, select the Basic menu
- 2. Tap Waypoint
  - a. Notice the selector is automatically set to Fixed position
  - b. Change the waypoint to Relative position.
- 3. Set the first waypoint (from point...)
- 4. Set the second waypoint (...to point)

	22	Switch					
	23	- Switch	$\sim$				
				+ Add U	Intil		

Detail The movement between two relative waypoints is always the shortest path for the robot depending on the move type.

The distance for relative waypoints refers to the Cartesian distance between the TCP in the two positions. The angle states how much the TCP orientation changes between the two positions, or more precisely, the length of the rotation vector describing the change in orientation.

It does not matter where the relative waypoint position was located around the robot, before the program moved into the relative waypoint.

As soon as PolyScope moves to the relative waypoint in the program tree, the robot moves from its current position, to the distance and in the direction the relative waypoint has saved. Repeated relative positions can move the robot arm out of its workspace.

Use Case:If you have a welding procedure, and you need to weld a seam around a rectangle, you can<br/>define the first corner with a fixed waypoint, and then make the robot and welding tool hit the<br/>remaining three corners using relative waypoints.Welding itemsThe first waypoint will start the welding seam around the rectangle, and the relative<br/>waypoints will finish the remaining corners.<br/>Then if you need to weld something that is still a rectangle, but larger or smaller, then you<br/>can change the distance of the relative waypoints, and quickly modify the robot program.

## Variable Waypoint

**Description** A variable waypoint moves to a position determined by a variable in PolyScope. The variable must be in the pose URScript format, p[x, y, z, rx, ry, rz], allowing a single waypoint in the Program Tree to be updated by changing the X, Y, Z, RX, RY, or RZ value without manually resetting the waypoint.

When to use:

- If combined with scripting elements.
- When receiving data from external devices for positioning like cameras, etc.

When not to use:

- When a specific location must be reached repeatably.
- If you are not using variables or external devices.
- If a waypoint must be moved manually, or redefined by either jogging or freedrive.

Add a variable waypoint	dd a variable waypoint that can be modified during run through of the robot	program.
Add a	1. In the Program tab, hit the basic menu	
variable waypoint to a robot	2. Add a move command	
	3. Select the automatically generated waypoint	
program	a. Notice that the selector is automatically set to Fixed position.	
	b. Change the selector to Variable position.	
	4. Select the variable from the drop-down menu.	

**Detail** A waypoint with the position given by a variable, in this case *calculated\_pose*.

The variable has to be a *pose* such as var=p[0.5,0.0,0.0,3.14,0.0,0.0].

The first three are *x*, *y*, *z* and the last three are the orientation given as a *rotation vector* given by the vector *rx*, *ry*, *rz*.

The length of the axis is the angle to be rotated in radians, and the vector itself gives the axis about which to rotate.

The position is always given in relation to a reference frame or coordinate system, defined by the selected feature.

If a blend radius is set on a fixed waypoint and the waypoints preceding and succeeding it are variable or if the blend radius is set on a variable waypoint, then the blend radius will not be checked for overlap (see Blending below).

If, when running the program, the blend radius overlaps a point, the robot will ignore it and move to the next one.

## Blending

DescriptionBlending enables the robot to smoothly transition between two trajectories, without<br/>stopping at the waypoint between them.<br/>Therefore, your robot program will run faster.

See the following sections for additional information on blending:

- Blend Parameters on page 105
- Blend Trajectories on page 107
- Conditional Blend Trajectories on page 108

Example:The robot starts at waypoint 1 (WP\_1), and it needs to pick up an object at waypoint 3Blending in a(WP\_3).pick and placeTo avoid collisions with the object and other obstacles, the robot must avoid (O) by usingapplicationwaypoint 2 (WP 2).

Three waypoints are introduced to create a path that fulfills the requirements.

14.1: (WP\_1): initial position, (WP\_2): via point, (WP\_3): pick up position, (0): obstacle.

Without configuring other settings, the robot will make a very brief but full stop at each waypoint, before continuing the movement.

For this task a stop at  $(WP_2)$  is not optimal since a smooth turn would require less time and energy while still fulfilling the requirements. It is even acceptable that the robot does not reach  $(WP_2)$  exactly, as long as the transition from the first trajectory to the second trajectory happens near this position.

The stop at  $(WP_2)$  can be avoided by configuring a blend for the waypoint. This allows the robot to calculate a smooth transition into the next trajectory.

The primary parameter for the blend is a radius.

When the robot is within the blend radius of the waypoint, it can start blending and deviate from the original path. This allows for faster and smoother movements, as the robot does not need to decelerate and re-accelerate.

## **Blend Parameters**

**Description** Blending enables the robot to smoothly transition between two trajectories, without stopping at the waypoint between them. Blending makes your robot program run faster because, when you create a smooth transition between trajectories, you avoid slowing down an acceleration between trajectories.

Blend parameters

- Apart from the waypoints, multiple parameters will influence the blend trajectory.
  - the blend radius (r)
  - the initial and final speed of the robot (at positions p1 and p2, respectively)
  - the movement time (e.g. if setting a specific time for a trajectory this will influence the initial/final speed of the robot)
  - the trajectory types to blend from and to (MoveL, MoveJ)

14.2: Blend over (WP\_2) with radius (r), initial blend position at p1 and final blend position at p2. (0) is an obstacle.

If a blend radius is set, the robot arm trajectory blends around the waypoint, allowing the robot arm not to stop at the point.

Blends cannot overlap, so it is not possible to set a blend radius that overlaps with the blend radius of a previous or following waypoint.

If there is overlap of two blends, there will be a warning logged in the Log tab. See the *Log tab* for more information.

14.3: Blend radius overlap not allowed (\*).

## **Blend Trajectories**

**Description** Blending enables the robot to smoothly transition between two trajectories, without stopping at the waypoint between them. Therefore, your robot program will run faster.

#### Blend Trajectories

14.1: Joint space (MoveJ) vs. cartesian space (MoveL) movement and blend.

Depending on the movement type (i.e., MoveL, MoveJ, or MoveP), different blend trajectories are generated.

- Blends in MoveP When blending in MoveP, the position of the blend follows a circle arc at constant speed. The orientation blends with a smooth interpolation between the two trajectories. You can blend a MoveJ or a MoveL into a MoveP. In such a case, the robot uses the circular arc blend of MoveP, and interpolate the speed of the two motions. You cannot blend a MoveP to a MoveJ or a MoveL. Instead, the last waypoint of the MoveP is regarded as a stop point with no blend. You cannot perform a blend if the two trajectories are at an angle close to 180 degrees (reverse direction) because it creates a circular arc with a very small radius which the robot cannot follow at constant speed. This causes a runtime exception in the program which can be corrected by adjusting the waypoints to cause a less sharp angle.
- Blends involving MoveJ MoveJ blends cause a smooth curve in joint space. This goes for blends from MoveJ to MoveJ, MoveJ to MoveL and MoveL to MoveJ. Blending is not performed if *time* is specified instead of *velocity* and *acceleration* for both motions.
- Blends in MoveL MoveL blends cause a smooth curve in Cartesian space. The orientation blends with a smooth interpolation between the two trajectories. The robot may decelerate on the trajectory before the blend to avoid very high accelerations (e.g., if the angle between the two trajectories are close to 180 degrees).

## **Conditional Blend Trajectories**

## Description

Blending enables the robot to smoothly transition between two trajectories, without stopping at the waypoint between them. Blending makes your robot program run faster because, when you create a smooth transition between trajectories, you avoid slowing down an acceleration between trajectories.

#### Conditional blend trajectories

This example is a very situational example, but it shows that the robot program may in a very rare situations calculate program nodes before execution.

The blend trajectory is affected both by the waypoint where the blend radius is set and the following one in the program tree.

In this example, the blend around is affected by  $(WP_1)$  and  $(WP_2)$ . The consequence of this becomes more apparent when blending around  $(WP_2)$  in this example. There are two possible ending positions and to determine which is the next waypoint to blend to, the robot must evaluate the current reading of the digital\_input[1] already when entering the blend radius.

That means the if...then expression is evaluated before we actually reach the destination which is somewhat counter-intuitive when looking at the program sequence. If a waypoint is a stop point and followed by conditional expressions to determine the next waypoint (e.g. the I/O command) it is executed when the robot arm has stopped at the waypoint. (WP\_2)

14.2: WP\_I is the initial waypoint and there are two potential final waypoints WP\_F\_1 and WP\_F\_2, depending on a conditional expression. The conditional if expression is evaluated when the robot arm enters the second blend (\*).

#### Add Until

Description

The program node Until defines stop criteria for a motion. You can add Until nodes from Direction and Waypoint commands. You can only add a direction node to a MoveL and MoveP. The robot moves along a path and stops when contact is detected.

You can add multiple stop criteria to a single movement. The motion stops when the first Until condition is met.

You can add multiple Add Until one after the other, because there can be multiple conditions that must be met, before an action is done or executed.

to save the expression

5. Choose if you want to use the shared deceleration or a custom deceleration

Distance	This node stops a Direction move when the robot moves a certain distance. The velocity is ramped down so the robot stops exactly at the specific distance. You can also use a specific distance as a stop condition.
Example	You can use the distance function to move the tool a specific distance before a full stop such as moving the tool away from a work piece.
Add an Until	1. When you have added the Until command, tap the
distance to a robot program	Distance
	2. Add the distance in mm
	<ol><li>Select to stop after it has moved the distance or blend with a radius. Click here to read more about blending.</li></ol>

**Tool Contact** This node allows the robot to stop motion when contact with the tool is established. You can use this node to stop a movement when the robot tool detects a contact.

You can also define the deceleration of the stop and the retraction of the tool.

**Example** You can use the Until Tool Contact Node for applications like Stacking/Destacking, where Until Tool Contact determines the height of stacked objects.

add a No Action to a robot program	<ol> <li>When you have added the Until command, tap the         <ul> <li>I/O Input</li> </ul> </li> <li>Select the analogue or digital input</li> <li>Add additional configuration</li> </ol>
Add Action	This node allows you to add a program node if a specific Until condition is met. You can also add an additional action to be executed right after an Until command.
Example	Until Tool Contact can engage the gripping action of a gripper tool. If no <b>Action</b> is defined, then program execution continues to the next program node in the Program Tree.
Add a No Action after an Until command	Add Action 1. Tap the 2. Select a node from the Node List to be added immediately after the Until command 3. Configure the node you just added

## 4.7.3. Direction

Description	The Direction command specifies a motion relative to feature axes or TCPs. The robot moves in the path specified by the Direction program node until that movement is stopped by an Add Until on page 110 condition.
Direction	The Direction command allows you to make the robot move in a specific direction.
Example	Direction vectors of [100,0,0] and [1,0,0] have the same effect on the robot; use the Speed Slider to moving along the x-axis at a desired speed. The values of the numbers in the direction vector only matter relative to each other.

Add a Direction	1. In your robot program, select the place or node where you wish to add a Direction command.			
movement to	2. Under Basic, tap <b>Direction</b> to add a linear movement to your Program Tree.			
a robot program	3. In the Direction field, under Feature, define the linear movement.			
	a. Select if you use the shared feature 🔘 Use shared feature			
	🔘 Base 🛛 🔻			
	Base			
	or the Base/Tool			
	<ul> <li>Select the cartesian direction from the Direction drop-down Direction</li> </ul>			
	or write the Direction vector manually			
	Direction vector			
	[0.0,1.0,0.0]			
	c. Select Shared parameters or define the tool speed and acceleration.			
	V Basic Q Command Graphics Variables			

4. Click Add Until to add a method of stopping the directional movement.

Select the feature and	Difference between Shared Feature or BASE/TOOL
direction	Difference between Direction and writing the Direction Vector
	The Direction Vectors define a custom code expression that is resolved to a unit vector.
Direction Movement	There are different ways to stop direction movement.

In the Direction field, tap the **Add Until** button to define and add stop criteria to your Program Tree.

DirectionThe Direction Vector settings allow you to define the vector direction for linear motion. UseVectorthe Tool Speed and Tool Acceleration for the following:

- to define linear motion relative to multiple feature axes
- · to calculate the direction as a mathematical expression

#### 4.7.4. Wait

**Description** The Wait command provides additional control of the robot's behavior. The Wait command pauses the robot's movement when new inputs are introduced into the program.

You can add a Wait command to a program with external sensors, to make the robot wait for one of the sensors to activate before the program continues.

When you add a Wait to your program tree, the Wait pane appears to the right of the screen.

See the following sections about using Wait:

- Add a No Wait to a robot program below
- Add Wait x seconds to a robot program on the next page
- Wait for digital input on page 119
- 4.7.4 Wait above
- Wait for f(x) expression on page 121

The robot pauses using different Wait commands. See the Wait command types below.

Add a No Wait	No Wait allows the robot to do nothing before continuing to run a program. There is no
to a robot	pause before new input.
program	pause belore new input.

- 1. In your Robot Program, select the place or node where you wish to add a Wait command.
- 2. Under Basic, tap Wait.
- 3. On the right side of the screen, tap the No wait selector.

The No Wait command can be used a temporary placeholder be used, when you are programming your robot program.

Add Wait x seconds to a robot program

This Wait command type allows the robot to hold position for a defined amount of time before continuing a program.

- 1. In your Robot Program, select the place or node where you wish to add a Wait command.
- 2. Under Basic, tap Wait.
- 3. Tap the Wait x seconds selector.

4. Tap the number box to select a value that determines the length of the Wait.

✔ Basic		Q Command Graphics Variables
Move Waypoint Direction Walt Set Popup Halt Comment Folder	1 Voit: 0.01	Wait       Please select what should trigger the robot's next action;         No Wait       Wait         Wait       0.01 seconds         Wait for Digital input <dlinput>       Low          Wait for <can.input>       4.0 mA         Wait for       f(x)</can.input></dlinput>

Power off	Speed 🥌	10	0% 🕑	$\mathbf{O}$	Simulation

Example: Wait<br/>for digital inputIf you have an external sensor at the end of a conveyor, you will use this function to wait<br/>for a command from the sensor, which tells the robot program that there is a work piece<br/>at the end of the conveyor.Wait for analog<br/>inputThis Wait command type allows the robot to hold position until a signal is received from<br/>an analog input.

Add a Wait for analog input to a robot program

- 1. In your Robot Program, select the place or node where you wish to add a Wait command.
- 2. Under Basic, tap Wait.
- 3. Tap the Wait for analog input selector.

- 4. In the An.input menu, select the new analog input.
- 5. Tap the Volts box to select a value that determines the voltage.
- In the angle brackets box, select either the less than <, or the greater than > symbol.

	Power off     Speed     100%     D     Simulation		
Тір	If you have multiple analog inputs, you can rename each one to make it easier to find them. [Go to I/O setup]		
Example: Wait for analog input	If you have a temperature sensor that is set up to the analogue I/O, you can configure the robot program to wait until a specific temperature.		
Wait for f(x) expression	This Wait command type allows the robot to hold position until an expression is <i>True</i> or [1]		
Add a Wait for f (x) variable to a	<ol> <li>In your Robot Program, select the place or node where you wish to add a Wait command.</li> </ol>		
robot program	2. Under Basic, tap Wait.		
	3. Tap the Wait for f(x) selector.		
	Wait for f(x)		

4. Tap the **f**(**x**) variable field to add an expression value.

Example: Wait for f (x) expression	You can add a wait command with an expression that waits for two or more conditions to be true or false depending on configuration when using a machine and a conveyor sensor. Both the machine and the conveyor become ready for the robot.	
4.7.5. Set		
Description	<ul> <li>The Set command is one of the most often used commands. The Set command can turn external devices on and off. The Set command can also increase or decrease current/voltage to external devices.</li> <li>You can always test your setup by using the test button in the right lower corner of the screen.</li> <li>See the following sections about using Set: <ul> <li>No Action below</li> <li>Set digital output on the facing page</li> <li>Set (variable) on page 124</li> <li>Set single pulse on page 124</li> <li>Set TCP on page 124</li> </ul> </li> <li>The robot uses different Set commands.</li> </ul>	
No Action Th	nis is used in combination with setting the active TCP.	

To add a No Action to a robot program

- 1. In your Robot Program, select the place or node where you wish to add a Set command.
- 2. Under Basic, tap Set.
- 3. Select No Action

Basic		Q Command Graphics Variables
Move Waypoint Direction Wait Set Popup Halt Comment Folder Set Payload Advanced Templates	1 X Variables Setup 2 ♥ Robot Program 3 ♥ ₱ Movel 4 ♥ Waypoint_1 5 ♥ Set	Set Select the action you wish the robot to perform at this point in the program. 	★ <b>↓ う ♂ X 目 直</b> 1	🛫 💳

Set digital output	The digital output should be planned as a start/stop or on/off action.		
	<ol> <li>In your Robot Program, select the place or node where you wish to add a Set command.</li> </ol>		
	2. Under Basic, tap Set.		
	3. Select Set Digital Output		
	4. Select your pre-named digital output (See 5.4 I/O Setup on page 178)		
	5. Set to High/Low		
Example: Set digital output	Use this Set command, if you want a conveyor to start or stop moving.		
Set analog output	The analogue output should be planned as a variable increase/decrease in current/voltage.		
	<ol> <li>In your Robot Program, select the place or node where you wish to add a Set command.</li> </ol>		
	2. Under Basic, tap Set.		
	3. Select Analog Output		
	4. Select your pre-named analogue output (See 5.4 I/O Setup on page 178)		
	<ol> <li>Input desired value (current or voltage depending on configuration in 7 I/O Tab on page 211</li> </ol>		
Example: Set analog output	Use this command, if you wish to increase the speed of a conveyor or dim the light in a lamp or diode.		

Set (variable) The output can also be modified by an expression. 1. In your Robot Program, select the place or node where you wish to add a Set command. 2. Under Basic, tap Set. 3. Select Set 4. Choose the pre-named output Add the expression in the input field. Example: Set You can set an output to list the output torque of a robot joint. (variable) Set single pulse The Set command can be used to deliver a steady pulse of a specific duration. The output will remain High during the pulse, and return to Low after the pulse has ended. 1. In your Robot Program, select the place or node where you wish to add a Set command. 2. Under Basic, tap Set. 3. Select Set Single Pulse 4. Select your pre-named digital output 5. Add your duration for the pulse in (s) Example: Set In order to ensure valid communication with older machinery, you can set a pulse to a single pulse high command for a duration, so that you ensure that the older machinery has time to register the command. Increment installation This is used to increase the number of a counter variable. variable by one 1. In your Robot Program, select the place or node where you wish to add a Set command. 2. Under Basic, tap Set. Select Increment installation variable by one 4. Select your variable from the dropdown menu.

**Example** If you need to know how many items that the robot has handled, you can add a counter and this Set command to increase the counter.

Set TCP

- 1. In your Robot Program, select the place or node where you wish to add a Set command.
- 2. Under Basic, tap Set
  - a. You can set the active TCP with any command variation from the above.
- 3. Tap Set TCP
- 4. Select TCP from dropdown menu

Example: SetIf you have a double gripper, you can use the Set command to change the active TCP to<br/>the other gripper.

#### 4.7.6. Popup

DescriptionThe Popup is a message that appears on the screen when the program reaches the<br/>Popup node in the program tree.<br/>Popup messages are limited to a maximum of 255 characters. You can choose to use<br/>different popup message types.

- Message
- Warning
- Error

A popup always pauses the main robot program. The main robot program is paused while the popup is active.

When to use:

- When you wish to continue or stop your program.
- When you wish to create a message to inform users.
- When you wish to control your part of a robot program.

Add a Popup to a robot program

- 1. In your robot program, select the place or node where you wish to add a Popup command.
- 2. Under Basic, tap Popup.
- 3. Add your text or choose a variable
- 4. Choose the popup type. The only change is the icon of the popup.

TipYou can also select Halt program execution at this popup for the program to stop<br/>when the popup appears.

Example: PopupIn a pick and place program, you can add a Message popup when the pallet is full and<br/>you need to add an empty pallet.<br/>During an inspection, you can add a Warning popup where you inspect an object. If the<br/>inspection is OK, continue the program. If the inspection is NOT OK, stop the program.

## 4.7.7. Halt

**Description** The Halt command allows you to stop the robot at a specific node in the robot program. It is the equivalent of pressing the STOP button.

You must restart the program after the halt command.

When you add a Halt to your robot program, the Halt pane appears to the right of the screen.

When to use:

• Include a Halt command if you reach a position with the robot program, where recovery is not possible, and you need to stop the program.

Halt

Add stops to specific points in the robot program.

- Add a Halt to a robot program
- 1. In your robot program, select the place or node where you wish to add a Halt command.
- 2. Under Basic, tap Halt.

Example:If there are no more parts for a welding application, or one of the parts have been incorrectlyHaltplaced in the welding pattern, you can add a Halt command.

## 4.7.8. Comment

Description	The Comment command allows you to keep track of decisions you make while you create or update your robot program.				
	You can add comments directly inside a robot program used by different users.				
	-	nt of the comment disp	am, the Comment pane appears to the right splays in the Comment pane.		
Comment	Add useful comments throug	ghout the robot progr	ram.		
Add a Comment to a robot program	<ul> <li>In your robot program</li> <li>Under Basic, tap Con</li> <li>Add your comment in</li> <li> Point Point&lt;</li></ul>	mment. the text field. Universal Robots Graphical Progra Proceeding of Command Commend Please enter Remember m back switch the payload wt	gramming Environment - • • * cunnamed>* iefault <sup>+</sup> Nex., Open., Save., CCCC Graphics Variables ent		

Example: Comment

The comments are mainly used by programmers to provide insight and help to other programmers on the same robot program.

## 4.7.9. Folder

Description The Folder command allows you to use folders to create an easy to read overview of the main parts of your robot program.

> Since each main part of the robot program can contain many program nodes, you can use folders to separate them into manageable sections.

Folders have no impact on the program's execution.

Folder

Organize your robot program in folders.

Add a Folder to a robot program

- 1. In your robot program, select a placement for your folder.
- 2. Under Basic, tap Folder.
- 3. You can now move nodes into the folder, or add nodes in the folder.

Example: Folder

One of the main uses of Folders is to collapse main sections of the robot program to provide a better overview of the robot program.

## 4.7.10. Set Payload

Description	The Set Payload command allows you to configure the payload for the robot. Payload is			
	the combined weight of everything attached to the robot tool flange.			
	When to use:			

- When adjusting the payload weight to prevent the robot from triggering a robot stop. A correctly configured payload weight ensures optimal robot movement.
   Setting the payload correctly ensures optimal motion performance and avoids robot stops.
- When setting up the payload for use in a pick and place program, using a gripper.

#### Set Payload

Use the Set Payload command

- 1. In your robot program, select the place or node where you wish to add a Set command.
- 2. Under Basic, tap Set Payload.
- 3. Use the drop-down, under Select Payload.
  - a. Select one of the payloads already configured.
  - b. Or, use the drop-down to configure a new payload by selecting **Custom Payload** and completing the mass and CoG fields.

		PROGRAM <b><unn< b=""> INSTALLATION <b>defaul</b></unn<></b>		Oper Save

> Templates		Transition Adjust the transition Duration	n time to smoother	n the payload change. 0.05 s	
	<b>▲ ↓ う ♂ X 単 箇 亩 三</b>				✓ Set Now
		Speed 10	0%	D 0	Simulation

Тір	You can also use the <b>Set Now</b> button to set the values on the node as the active payload.
Use tip	Remember to always update your payload when making any changes to the configuration of the robot program.
Example: Set Payload	In a pick and place program, you would create a default payload in the installation. Then you add a Set Payload when picking up an object. You would update the payload after the gripper closes, but before starting to move. Additionally, you would use the Set Payload after the object has been released.

PayloadThis is the time it takes the robot to adjust for a given payload. At the bottom of theTransition TimeScreen, you can set the transition time between different payloads.<br/>You can add a payload transition time in seconds.<br/>Setting a transition time larger than zero, prevents the robot from doing a small "jump",<br/>when the payload changes. The program continues while the adjustment is taking place.<br/>Using the Payload Transition Time is recommended when<br/>picking up or releasing heavy objects or using a vacuum gripper.

## 4.8. Advanced program nodes

**Description** The advanced program nodes are used to add additional functionality for your robot program, such as; subprograms, if-parameters, scripts and loops.

#### 4.8.1. Loop

**Description** Loops the underlying program commands. Depending on the selection, the underlying program commands are either looped infinitely, a certain number of times or as long as the given condition is true. When looping a certain number of times, a dedicated loop variable (called  $loop_1$  in the screen shot above) is created, which can be used in expressions within the loop. The loop variable counts from 0 to N-1.

# Looping anWhen looping using an expression as end condition, PolyScope provides an option for<br/>continuously evaluating that expression, so that the "loop" can be interrupted anytime<br/>during its execution, rather than just after each iteration.

## 4.8.2. SubProgram

**Description** A SubProgram can hold program parts that are needed several places. A SubProgram can be a separate file on the disk, and can also be hidden to protect against accidental changes to the SubProgram.

		PROGRAM <b><unnamed>* 📴 📷 🖬 CCCC</unnamed></b>

## 4.8.3. Assignment

#### Description

Assigns values to the variables. The variable value can be the result of expressions created in the Expression Editor (see section 4.3 Expression Editor on page 77). You can also request a variable value from an operator. When requesting a value from an operator, it is possible to display an Operator Message to validate input against common variable types.

#### 4.8.4. lf

**Description** If and If...Else statements change the robot's behavior based on sensor inputs or variable values.

#### NOTICE

If there are waypoints inside an If expression or inside a Loop expression with the Check Expression Continuously option, you can add a stopj() or a stopl() after the expression to gently decelerate the robot arm. This is valid for both If and Loop Commands (see section ).

#### Select Conditions

Select conditions in the Expression Editor that make up expressions using an **If** statement. If a condition is evaluated as True, the statements within this **If** command are executed. An **If** statement can have only one **Else** statement. Use **Add Elself** and **Remove Elself** to add and remove Elself expressions.

Select Check Expression Continuously to allow If, Elself and Loop statements to be evaluated while the contained lines are executed. If an expression inside an If statement is evaluated as False, the Elself or Else statements are followed.

## 4.8.5. Script

Description

The following options are available in the drop down list under Command:

- Line allows you to write a single line of URscript code, using the Expression Editor (4.3 Expression Editor on page 77)
- File allows you to write, edit or load URscript files.

You can find instructions for writing URscript in the Script Manual on the support website (<u>http://www.universal-robots.com/support</u>).

Functions and variables declared in a URscript file are available for use througout the program in the PolyScope.

## 4.8.6. Event

Description

An event can be used to monitor an input signal, and perform some action or set a variable when that input signal goes high.

For example, in the event that an output signal goes high, the event program can wait for 200ms and then set it back to low again.

This can make the main program code a lot simpler in the case on an external machine triggering on a rising flank rather than a high input level.

Events are checked once every control cycle (2ms).

#### 4.8.7. Thread

#### Description

A thread is a parallel process to the robot program. A thread can be used to control an external machine independently of the robot arm. A thread can communicate with the robot program with variables and output signals.

#### 4.8.8. Switch

DescriptionA Switch Case construction can make the robot change behavior based on sensor inputs<br/>or variable values.<br/>Use the Expression Editor to describe the base condition and define the cases under

which the robot should proceed to the sub-commands of this Switch. If the condition is evaluated to match one of the cases, the lines inside the Case are executed. If a Default Case has been specified, then the lines will be executed only if no other matching cases were found. Each Switch can have several Cases and one Default Case. Switches can only have one instance of any Case values defined. Cases can be added using the buttons on the screen. A Case command can be removed from the screen for that switch.

		PROGRAM <unnamed>*</unnamed>
> Basic	Q	Command Graphics Variables

#### 4.8.9. Timer

#### Description

A Timer measures the length of time it takes for specific parts of the program to run. A program variable contains the time passed since a Timer started, and can be seen in the Variables Tab and in the Run Tab.

Run Program Installation		Ē
<ul> <li>&gt; Basic</li> <li>&gt; Advanced</li> <li>Loop</li> <li>SubProg</li> <li>Assignment</li> <li>If</li> <li>Script</li> <li>Event</li> <li>Thread</li> <li>Switch</li> <li>Timer</li> <li>Home</li> <li>&gt; Templates</li> </ul>	Q Command Graphics Variables     1 X Variables Setup     2 Robot Program   3  Movel   4  Waypoint_1    5  Set    6 Wait   7  Popup    8  Halt    9  Comment   10  Folder    11  Set    12  Comment    13  Set of Call    14  Call    15  Svirpt    19  Switch    20  Simpt/> <b>Comment</b> 10    11    -    -   12   -    Start   -    Start   -   Start   - </th <th></th>

#### 4.8.10. Home

#### Description

The Home node uses joint angles to move the robot to a predefined Home position. If defined as a Safe Home position, the Home node displays as Home(Safety) in the Program Tree. If the Home position is out of sync with Safety, the node is undefined.

#### Defining Home

Home is a user-defined return position for the Robot Arm. Once defined, the Home Position is available when creating a robot program. You can use the Home Position to define a Safe Home Position. (See 2.9 Safe Home Position on page 55) Use the Home screen buttons for the following:

- Edit Position modifies a Home Position.
- Move here moves the Robot Arm to the defined Home Position.
- Zero Position returns the Robot Arm to an upright position.
- 1. In the Header, tap Installation.
- 2. Under General, select Home.
- 3. Tap Set Position.
- 4. Teach robot using either Freedrive or Transition buttons.

## 4.9. Templates

Description	The templates can be used to add specific functionality to a robot program. The different templates will enable the you to perform complex tasks with your robot program.
4.9.1. Seek	
Description	The seek function uses a sensor to determine the correct position to grab or drop an item. This function allows for working on stacks of items of varying thickness, and determining the exact positions of the items are either unknown or too hard to program. The sensor can be a push button switch, a pressure sensor or a capacitive sensor.
Seek	To program a seek operation, define the following:
	• A - the starting point.
	• <i>B to C</i> - the stack direction. This means growing the stack when Stacking and shrinking the stack when Destacking.
	• D - the thickness of the items in the stack.
F	You must also define the condition for when the next stack position is reached, and a special program sequence that is performed at each stack position.

Speed and accelerations need to be given for the movement involved in the stack operation.

#### Stacking

During Stacking, the robot arm moves to point *A*, then moves *opposite* the direction to search for the next stack position. When the next stack position is found, the robot remembers it and performs the special sequence.

In subsequent rounds, the robot starts the search from the remembered position, incremented by the item's thickness along the direction.

Stacking is complete when the stack height is more than some defined number, or when a sensor gives a signal.

# **Destacking** During Destacking, the robot arm moves from point *A* in the given direction to search for the next item. The condition on the screen determines when the next item is reached. When the condition is satisfied, the robot remembers the position and performs the special sequence.

In subsequent rounds, the robot starts the search from the remembered position, incremented by the item's thickness along the direction.

## Starting position

The starting position is where the stack operation starts. If the starting position is omitted, the stack starts at the robot arm's current position.

Direction The direction, given by positions B to C, is calculated as the position difference from the TCP of B to the TCP of C. D

Command	Action
Next Stacking Position Expression	The robot arm moves along the direction vector while continuously evaluating whether the next stack position has been reached. When the expression is evaluated to True the special sequence is executed.
BeforeStart	The optional BeforeStart sequence is run just before the operation starts. This can be used to wait for ready signals.
AfterEnd	The optional AfterEnd sequence is run when the operation is finished. This can be used to signal conveyor motion to start, preparing for the next stack.
Pick/Place Sequence	The Pick/Place Sequence is a special program sequence performed at each stack position, similar to the Pallet operation.

## 4.9.2. Force

### Description

**Force mode** is suited to applications where the actual TCP position along a predefined axis is not important, but instead a desired force along that axis is required. For example, if the robot TCP rolls against a curved surface, pushes or pulls a workpiece.

**Force mode** also supports applying certain torques around predefined axes. The robot arm attempts to accelerate along that axis, if no obstacles are met in an axis where a non-zero force is set. Although an axis is selected to be compliant, the robot program still tries to move the robot along that axis. However, force control assures that the robot arm still approaches the specified force.

### NOTICE

Using this function at the same time as Conveyor Tracking and/or Path Offset can lead to program conflict.

• Do not use this function together with Conveyor Tracking or Path Offset.

### NOTICE

If there is a Force node inside an If, ElseIf or Loop, and the Check Expression Continuously option is selected, you can add an end\_ force\_mode() script at the end of the expression to exit force control.

146

WARNING

- 1. Avoid high deceleration just before entering force mode.
- 2. Avoid high acceleration in force mode, since it decreases force control accuracy.
- 3. Avoid movements parallel to compliant axes before entering force mode.

FeatureThe Feature rselectionis operating in

The **Feature menu** is used to select the coordinate system (axes) the robot will use while it is operating in force mode. The features in the menu are those which have been defined in the installation.

Force	The types of force mode, listed below, determine how the selected feature is interpreted.						
mode type	<ul> <li>Simple: Only one axis will be compliant in force mode. The force along this axis is adjustable. The desired force will always be applied along the z-axis of the selected feature. However, for Line features, it is along their y-axis.</li> </ul>						
	<ul> <li>Frame: The Frame type allows for more advanced usage. Here, compliance and forces in all six degrees of freedom can be independently selected.</li> </ul>						
	• <b>Point</b> : When Point is selected, the task frame has the y-axis pointing from the robot TCP towards the origin of the selected feature. The distance between the robot TCP and the origin of the selected feature is required to be at least 10 mm. The task frame changes at runtime as the position of the robot TCP changes. The x- and z-axis of the task frame are dependent on the original orientation of the selected feature.						
	<ul> <li>Motion: Motion means that the task frame will change with the direction of the TCP motion. The x-axis of the task frame will be the projection of the TCP movement direction onto the plane spanned by the x- and y-axis of the selected feature. The y-axis will be perpendicular to the robot arm's motion, and in the x-y plane of the selected feature. This can be useful when de-burring along a complex path, where a force is needed perpendicular to the TCP motion.</li> </ul>						
	When the robot arm is not moving: If force mode is entered with the robot arm standing still, there will be no compliant axes until the TCP speed is above zero. If later, while still in force mode, the robot arm is again standing still, the task frame has the same orientation as the last time the TCP speed was larger than zero.						
	For the last three types, the actual task frame can be viewed at runtime on the graphics tab (see ), when the robot is operating in force mode.						
Force value selection	<ul> <li>Force or torque value can be set for compliant axes, and robot arm adjusts its position to achieve the selected force.</li> </ul>						
	<ul> <li>For non-compliant axes robot arm will follow the trajectory set by the program.</li> </ul>						
	For translational parameters, the force is specified in Newtons [N] and for rotational the torque is specified in Newton meters [Nm].						
	<ul> <li>NOTICE         You must do the following:         <ul> <li>Use get_tcp_force() script function in separate thread, to read actual force and torque.</li> <li>Correct wrench vector, if actual force and/or torque is lower than requested.</li> </ul> </li> </ul>						

Speed limits Maximum Cartesian speed can be set for compliant axes. The robot moves at this speed in force control, as long as it does not come into contact with an object.

Test forceThe on/off button, labelled Test, toggles the behavior of the Freedrive button on the back ofsettingsthe Teach Pendant from normal Freedrive mode to testing the force command.

When the **Test button** is on and the **Freedrive** button on the back of the Teach Pendant is pressed, the robot will perform as if the program had reached this force command, and this way the settings can be verified before actually running the complete program. Especially, this possibility is useful for verifying that compliant axes and forces have been selected correctly. Simply hold the robot TCP using one hand and press the **Freedrive** button with the other, and notice in which directions the robot arm can/cannot be moved.

Upon leaving this screen, the Test button automatically switches off, which means the **Freedrive** button on the back of the Teach Pendant is again used for regular **Freedrive** mode.

The **Freedrive** button is only effectual when a valid feature is selected for the Force command.

## 4.9.3. Palletizing

Description	Palletizing is a template to easily program palletizing and depalletizing tasks, picking- and-placing parts (i.e., from trays, fixtures, etc.), and having the robot perform repeatable actions for different items in multiple layers with different patterns. You can create different patterns and apply them to specific layers. You can also place a separator between each layer (see ). Furthermore, you can use Features from Pallet Properties to easily adjust the placement of your pallet. To learn about Features, see Follow the <b>Creating a Palletizing Program</b> section below to use the Palletizing template.
Creating a	1. Decide if you want to teach a Feature (see ) or use a Base as a reference plane.
Palletizing	2. In the Program Tab, under Templates, tap Palletizing.
Program	<ol><li>On the Palletizing screen, select one of the following actions depending on the desired action.</li></ol>
	1. Select Palletizing to organize items onto a pallet.
	2. Select <b>Depalletizing</b> to remove items from a pallet.
	4. Under Pallet Properties, specify the Name, Feature (see Step 1), Object Height, and Item Counter name for your program. Select the Remember last item location box if you want the robot to restart at the item it was handling when it stopped.
	<ol><li>On the Palletizing screen, under Actions, add additional actions to be performed before or after palletizing sequence by selecting the following:</li></ol>
	<ol> <li>Add Action Before Palletizing: These actions are performed before starting to palletize.</li> </ol>
	<ol> <li>Add Action After Palletizing: These actions are performed after finishing palletizing.</li> </ol>
	<ol> <li>On the Program Tree, tap the Patterns node to designate patterns for your layers. You can create the following type of patterns: Line, Grid, or Irregular (see figure below). On this screen, you can select if you want to include a separator between layers (see ).</li> </ol>
	<ol> <li>Tap the pattern node(s) on the Program Tree to teach the robot layer-specific positions (e.g., start/end points, grid corners, and/or number of items). See for teaching instructions. All positions must be taught at the bottom of the pallet. To</li> </ol>

you wish to duplicate.
8. In the Program Tree, tap the Layers node to configure the layers of your palletizing sequence. Use the Choose Pattern drop-down menu to select the pattern for each layer. Tap the Add layer button to add additional layers to your program. Layers must be added in the correct order, as they cannot be reordered later.

duplicate a pattern, tap the **Duplicate pattern** button on the Pattern node screen that

Creating a Palletizing Program  In the Program Tree, tap At Each Item node. Choose to use the default option (A) At Each Item Wizard, or (B) Manually Configure At Each Item. Instructions for each option are below.

At EachThe At Each Item Wizard assists in defining the actions performed at each item on a pallet,Item Wizardsuch as the ReferencePoint, the Approach Waypoint, ToolActionPoint Waypoint, and ExitWaypoint (described in the table below). The Approach and Exit Waypoints for each item<br/>remains in the same orientation and direction regardless of the different items' orientation.

- 1. Tap the At Each Item node on the Program Tree.
- 2. On the At Each Item screen, tap Next.
- 3. Tap the **Move Here** button. Then, hold the **Auto** button or use the **Manual** button to move the robot to the ReferencePoint. Tap the **Continue** button. Tap **Next**.
- 4. Tap Set Waypoint to teach the Approach Waypoint (see ). Tap Next.
- 5. Repeat Step 3.
- 6. Tap Set Waypoint to teach the Exit Waypoint (see ). Tap Next.
- 7. Tap Finish.
- 8. You can now add appropriate gripper action nodes in the Tool Action folder in the Program Tree.

Manual	1. Tap the At Each Item node on the Program Tree.				
Configuration	2. On the At Each Item start screen, tap Manual Configuration.				
	<ol> <li>Use the drop-down menus to select a Pattern and a ReferencePoint item. Tap the Use this ReferencePoint button to set the ReferencePoint.</li> </ol>				
	4. Move the robot to the ReferencePoint by tapping Move Here.				
	<ol> <li>Tap the Approach node in the Program Tree to teach the robot the Approach Waypoint (see ). The Approach Waypoint remains in the same orientation and direction regardless of the different items' orientation.</li> </ol>				
	6. Tap the At Each Item node in the Program Tree. Repeat Step 4.				
	7. Tap the Exit node in the Program Tree to teach the robot the Exit Waypoint (see ).				
	<ol> <li>You can now add appropriate gripper action nodes in the Tool Action folder in the Program Tree.</li> </ol>				
Adding a Separator	Separators, such as paper or Styrofoam, can be placed between layers in a palletizing sequence. To add separators between layers, follow the instructions below:				
Between Layers in a	1. On the Program Tree, select the Patterns node.				
Palletizing Sequence	<ol> <li>On the Patterns screen, select Separator and define the height using the Separator Height text box. If the height is not defined, the program will not run.</li> </ol>				
Sequence	<ol> <li>Select Layers in the Program Tree. On the Layers screen, select which layers you want the separators to go between (separators are automatically placed between each layer).</li> </ol>				
	<ol> <li>Tap the Separator node in the Program Tree. Tap Set Separator to teach the Separator Position.</li> </ol>				

5. Choose between using the default option (A) Separator Wizard, or (B) Manually Configure the Separator sequence. Instructions for each option are below.

When the wizard is complete, or if you cancel the wizard, a template appears in the Program Tree under **Separator Action**. In addition to the Tool Action folder under the Separator Action node, you can select one of the following folders:

- Pick Up Separator to program the robot to pick up separators for palletizing
- Drop Off Separator to drop off separators for depalletizing

(A) Separator	1. Tap the Separator Action node on the Program Tree.				
Wizard	2. On the Separator Action screen, tap Next.				
	<ol><li>Tap the Move Here button and hold the Auto button or use the Manual button to move the robot to the Separator Point. Tap the Continue button. Tap Next.</li></ol>				
	4. Tap Set Waypoint to teach the Approach Waypoint (see ). Tap Next.				
	5. Repeat Step 3.				
	6. Tap Set Waypoint to teach the Exit Waypoint (see ). Tap Next.				
	7. Tap <b>Finish</b> .				
	<ol> <li>You can now add appropriate action nodes in the Pick Up Separator, Drop Off Separator, and Tool Action folders in the Program Tree.</li> </ol>				
(B) Manual	1. Tap the Separator Action node on the Program Tree.				
Configuration	2. On the Separator Action start screen, tap Manual Configuration.				
	3. Move the robot to the Separator Point by tapping Move to Separator Point.				
	<ol> <li>Tap the Approach node in the Program Tree to teach the robot the Approach Waypoint (see ).</li> </ol>				
	5. Tap the Separator Action node in the Program Tree. Repeat Step 3.				
	6. Tap the Exit node in the Program Tree to teach the robot the Exit Waypoint (see ).				
	<ol> <li>You can now add appropriate action nodes in the Pick Up Separator, Drop Off Separator, and Tool Action folders in the Program Tree.</li> </ol>				
Options to Customize A	<ul> <li>You can customize your palletizing program in the following ways:</li> <li>If your pallet needs to be adjusted or re-positioned after you have created a</li> </ul>				
Palletizing Program	palletizing program, you only need to re-teach the pallet Feature (see ) because the palletizing sequence is fixed relative to the Feature. Thus, all other program components automatically adjust to the newly taught position.				
	<ul> <li>You can edit the properties of the move commands (see ).</li> </ul>				
	<ul> <li>You can change the speeds and blends radii (see ).</li> </ul>				
	<ul> <li>You can add other program nodes to the At Each Item sequence or the Separator Action sequence.</li> </ul>				

### Positions

Line		To teach the positions, select each item in the Program Tree:				
		StartItem1				
		EndItem1				
		Insert the number of items in your				
		sequence using the <b>Items</b> text box at the bottom of the screen.				
		To teach the positions, select each item in the Program Tree:				
	<b>1</b>	CornerItem1				
		CornerItem2				
Grid		CornerItem3				
		CornerItem4				
		Insert the number of rows and columns in the appropriate text boxes to set the dimensions of the pattern.				
		To teach the positions, select each item in the Program Tree:				
		• Item1				
Irregular		• Item2				
		• Item3				
		Tap <b>Add Item</b> to add and identify a new item in the sequence.				

### Actions

Tool Action Point	The location and position you want the robot to be in when conducting an action for each item in a layer. The ToolActionPoint Waypoint is the ReferencePoint by default, but it can be edited in the Program Tree by tapping the ToolActionPoint Waypoint node. When using the wizard, the ReferencePoint is the first position in the first defined layer on the pallet. The ReferencePoint is used to teach the robot the Approach Waypoint, ToolActionPoint Waypoint, and Exit Waypoint for each item in a layer.
Approach	The collision-free position and direction you want the robot to take when approaching an item in a layer.
Tool Action	The action you want the robot attachment to perform for each item.
Exit Waypoint	The position and direction you want the robot to take when moving away from an item in a layer.

### 4.9.4. Conveyor Tracking

Description

Conveyor Tracking allows the Robot Arm to track the movement of up to two conveyors. Conveyor Tracking is defined in the Installation Tab.

### NOTICE

Using this function at the same time as Force and/or Path Offset can lead to a program conflict.

• Do not use this function together with Force or Path Offset.

The Conveyor Tracking program node is available in the Program Tab under Templates. All movements under this node are allowed while tracking the conveyor, but they are relative to the motion of the conveyor belt. Blends are not allowed when exiting Conveyor Tracking, so the robot stops completely before making the next motion.

Tracking a Conveyor

- 1. In the Header, tap **Program**.
- 2. Tap **Templates** and select **Conveyor Tracking** to add a Conveyor Tracking node to the Program Tree. Any movements listed under the Conveyor Tracking node tracks the movement of the conveyor.
- 3. Under Conveyor Tracking, in the Select Conveyor dropdown list, select **Conveyor 1** or **Conveyor 2** to define which conveyor must be tracked.

i

### NOTICE

If there is a Conveyor Tracking node inside an If, ElseIf or Loop, and the Check Expression Continuously option is selected, you can add an end\_conveyor\_tracking() script at the end of the expression to exit conveyor tracking.

## 

### Software Handbook

## 4.9.5. Screwdriving

Description

The **Screwdriving** program node provides an easy way to add a screwdriving application for an attached screwdriver. Configuring the screwdriver and its connections to the robot is defined in the Installation Tab (see General).

			rw Open Save	
Basic		Q Command Graphics	s Variables

		Force	N	
	<	Speed limit	mn	Vs
	▲ ♥ つ ♂ ※ ■ 箇 面	+ Add Until		
Normal		Speed 100%	D C (	

### Adding a Screwdriving Node

- 1. In the Header, tap **Program**.
- 2. Under Templates, tap Screwdriving.
- 3. Select **Tighten** to follow the screw in a tightening direction (in), or select **Loosen** to follow the screw in a loosening direction (out). This selection only impacts the motion of the robot to follow the screw and its measuring calculations.
- 4. In the **Program Selection** field, you can select a screwdriver program, depending on the **Program Selection** signals in the Installation.
- Select Enable Starting Point, to add a MoveL to the Program Tree that is executed when the screwdriver is already running. Select Enable Machine Error Handler, to add a corrective measure, if required, to the Program Tree before the screwdriving actions begins.

Affect screwdriving action Selecting **Follow the Screw**, under **Process**, to affect the screwdriving action in the following ways:

• Force: Select Force to define how much force is exerted on a screw. Then select **Speed Limit**, so the robot moves at this speed as long as it does not come into contact with the screw.

### CAUTION

Place the screwdriver bit above the screw before starting a screwdriving program. Exerting any force on the screw can affect the screwdriving program performance.

- Speed: Select a fixed Tool Speed and Acceleration for the robot to follow the screw.
- Expression: Similar to the If command (see 4.8.4 If on page 133), select Expression to describe the condition under which the robot follows the screw.

### **Screwdrive Until**

Description

The Screwdriving program node includes a mandatory until success **Until** node that defines stop criteria for the screwdriving process.

Success: Screwdriving continues until completion is detected using your selected

Error: Screwdriving continues until an error is detected using your selected option/s.

You can define the following stop criteria:

Criteria

### Success

You can add more than one error condition.

option. You can only add one success condition.

- OK: Screwdriving continues until an OK signal from the screwdriver is detected.
- Time: Screwdriving continues upto a defined time.
- **Distance**: Screwdriving continues upto a defined distance.
- **Expression**: Screwdriving continues until a custom expression condition is met.

### Error

- Not OK: Screwdriving stops when a NOT OK signal from the screwdriver is detected.
  - **Distance**: Screwdriving stops when the defined distance is exceeded.
  - **Timeout**: Screwdriving stops when the defined time is exceeded.

## 4.10. URCaps

#### Description

The Remote TCP and Toolpath URCap allows you to set Remote Tool Center Points (RTCP), where the tool center point is fixed in space, relative to the base of the robot. The Remote TCP and Toolpath URCap also allows for programming waypoints and circle moves, and generating robot motion based on imported toolpath files defined in third-party CAD/CAM software packages.

The Remote TCP URCap requires your robot to be registered before use (see Robot Registration and License File on page 233). The RTCP works in applications that require the robot to grasp and move items, relative to a fixed tool. The RTCP is used together with the RTCP\_MoveP and RTCP\_CircleMove commands to move a grasped part with constant speed, relative to the fixed tool.

Similar to a regular TCP (see ) you can define and name an RTCP in the Installation Tab's Setup.

You can also complete the following actions:

- · Add, rename, modify, and remove RTCPs
- Understand the default and active RTCP
- Teach RTCP position
- Copy RTCP orientation

Setting the Remote TCP from a Feature Set an RTCP using a Feature to allow the robot to be jogged relative to the RTCP while creating RTCP Waypoints and RTCP Circle Moves.

- 1. Tap the plus icon to create a new RTCP **RTCP**. Or select an existing RTCP in the drop-down menu.
- 2. Tap the **Copy values from a point feature** drop-down menu and select a Feature. Verify the RTCP orientation values update to match that of the selected Feature.

### Remote TCP Movement

### Types

RTCP\_Similar to a regular MoveP, the RTCP\_MoveP defines the tool speed and acceleration theMovePRobot Arm moves relative to the Remote TCP. See .

RTCP CircleSimilar to a regular Circle move, the RTCP Circle move can be added to an RTCP\_MovePmoveto make circular movements. See .

### NOTICE

The maximum speed of a Circle Move may be lower than the specified value. The circle radius is *r*, the maximum acceleration is *A*, and the maximum speed cannot exceed *Ar* due to centripetal acceleration.

# Remote TCP Similar to regular waypoints, RTCP Waypoints allow a tool to move linearly using constant speed and circular blends. The default blend radius size is a shared value between all the waypoints. A smaller blend radius size sharpens the path turn. A larger blend radius size smoothens the path. RTCP Waypoints are taught by physically moving the Robot Arm to a desired position.

### Teaching Remote TCP Waypoints

- 1. In the Program Tab, insert an **RTCP\_MoveP** node.
- 2. On the RTCP\_MoveP node, tap **Set** to bring up the Move screen.
- 3. On the Move screen, use **Teach Mode** or **Jog** to position the robot in a desired configuration.
- 4. Tap the green check mark to validate.

Configuring anUse blends to enable the robot to smoothly transition between two trajectories. Tap UseRTCPShared Blend Radius or tap Blend with radius to set the blend radius for a waypoint fromWaypointan RTCP\_MoveP.

### NOTICE

A physical time node (e.g. Move, Wait) cannot be used as a child of an RTCP\_MoveP node. If an unsupported node is added as a child to an RTCP\_MoveP node, the program fails to validate.

Remote TCP Toolpath The Remote TCP and Toolpath URCap generates robots motions automatically, making it easier to follow complex trajectories accurately.

Configuring a Remote TCP Toolpath	<ol> <li>Select Remote TCP Toolpath Moves on the Remote TCP &amp; Toolpath URCap Home Page to enter the workflow.</li> <li>Follow the instructions under the Instructions Tab.</li> <li>A Remote TCP Toolpath Move requires the following major components:         <ul> <li>Toolpath file</li> <li>Remote TCP</li> <li>Remote TCP</li> </ul> </li> </ol>
Configuring a Toolpath using CAD/CAM Software	<ul> <li>A toolpath defines the orientation, trajectoy, speed or (feed rate) and travel direction of the tool.</li> <li>1. Create or import a CAD model of a part.</li> <li>2. Set up a Part Coordinate System (PCS) fixed to the part.</li> <li>3. Create a toolpath relative to the PCS based on part features</li> <li>4. Simulate the toolpath motion to verify it meets expectation.</li> <li>5. Export the toolpath into a G-code file with .nc file extension.</li> </ul>
Importing a G- code Toolpath into PolyScope	<ul> <li>1. Load the toolpath files in the root directory of a USB stick. Toolpath files must have the .nc extension</li> <li>2. Insert the USB stick into the Teach Pendant.</li> <li>3. In the Header, tap Installation, tap URCaps, select Remote TCP &amp; Toolpath, select Remote TCP - Toolpath Moves, and select Toolpath.</li> <li>4. Select which toolpath files to import into Polyscope.</li> </ul>

Remote TCP Configuring a Remote TCP for Toolpath Moves

- 1. At the first waypoint in the CAM environment, determine the tool orientation.
- 2. Use Freedrive to manually grasp the part with the gripper.
- 3. Select the location of the Remote TCP
- 4. Use the position wizard to obtain the positive values.
- Adjust the robot until the desired part pose for approaching the remote TCP is acheived.
- 6. Envision the tool orientation at the first waypoint on the physical part. The positive Zaxis direction should point away from the part surface.
- 7. Create a Plane Feature with the same orientation as envisioned in the previous step.
- 8. Set the Remote TCP orientation by copying values from the Plane Feature. The desired part pose is maintained while the toolpath is executed.

Remote TCPThe Remote TCP Part Coordinate System (PCS) is defined as fixed relative to the robot<br/>tool flange. Tap the wand, on the PolyScope screen, to activate the wizard to teach the<br/>Remote TCP PCS. You can use either of the teaching methods described below.

Configuring a	Use this method if the PCS can be set on the part surface.
Remote TCP PCS	1. Use freedrive to manually grasp the part with the gripper.
FCS	<ol><li>Select a Remote TCP to teach the reference points. For high accuracy, temporarily set up a sharp Remote TCP to complete this teaching process.</li></ol>
	<ol><li>Jog the robot for the Remote TCP to touch the origin, positive X-axis and the positive Y-axis direction of the PCS on the part.</li></ol>
	<ol> <li>Tap Set to conclude the teaching process. The position and orientation values are populated automatically.</li> </ol>
	Otherwise, use this method.
	1. Select three or four reference points on the part surface.
	<ol> <li>In the CAD/CAM software, record the X, Y, Z coordinates, relative to the PCS of the selected reference points.</li> </ol>
	3. Use freedrive to to manually grasp the part with the gripper.
	<ol> <li>Select a Remote TCP to teach the reference points. For high accuracy, temporarily set up a sharp Remote TCP to complete this teaching process.</li> </ol>
	5. Enter the coordinates for the first reference point.
	6. Jog the robot for the Remote TCP to touch the first reference point on the part.
	7. Repeat steps five and six for the other reference points.
Setting a Variable PCS	For advanced use cases, where the part is not grasped with high consistency, you can set a Variable PCS to adjust the toolpath moves according to the part location and orientation relative to the robot tool flange. You can create a pose variable tied to an external sensor that can detect the PCS location and orientation.
	<ol> <li>Set up an external sensor that detects the PCS location and orientation. You must convert the sensor output to the robot tool flange frame.</li> </ol>
	<ol><li>Verify the PCS is set up relative to the part and the location and orientation are detectable by the external sensor.</li></ol>
	<ol> <li>In PolyScope, create a pose variable tied to the external sensor output as a variable PCS. Give it a distinct name, for example, variable_rtcp_pcs_1.</li> </ol>
	4. Insert an RTCP Toolpath Node.
	<ol> <li>At the top right corner of the program page, in the drop-down menu, select Variable PCS.</li> </ol>
	6. In the Select PCS drop-down menu, select variable_rtcp_pcs_1.
	<ol> <li>Create an Assignment or Script node to update variable_rtcp_pcs_1 before the RTCP Toolpath Node.</li> </ol>

166

Configuring aThe following section explains how to use a variable PCS in a Remote TCP ToolpathRemote TCPnode.

Toolpath Node

- 1. Access the Program Tab and tap **URCaps**.
- 2. Select Remote TCP Move to insert an RTCP\_MoveP node.
- 3. Select a TCP and set the motion parameters: tool speed, tool acceleration and blend radius.
- 4. Tap **+Toolpath** to insert an RTCPToolpath node. Delete the RTCPWaypoint node that was created by default, if it is not needed.
- 5. Select a toolpath file and the corresponding Remote TCP PCS from the drop-down menus.
- 6. Adjust the motion parameters if different values are to be applied to the RTCPToolpath node.
- 7. Tap **Move to First Point** to verify the grasped part approaches the Remote TCP as expected.
- 8. Test the program in the simulation mode at a low speed to confirm the configurations.

		PROGRAM <b><unna< b=""> INSTALLATION <b>default</b></unna<></b>	* L#	Open Save	÷ د د د ا

				Use shared tool speed	
ৰ		•	-	Tool speed	<b>250</b> mm/s
			C	1001 speed	250 mm/s
		+ Toolpath		Use shared tool accele	ration
			C	Tool acceleration	<b>200</b> mm/s <sup>2</sup>
		🔥 A toolpath file r	must be selected.		
	<b>▲ ╄ つ ♂ X 匠 箇 面 </b>				
Normal	Speed	100%	D		Simulation

You can ensure the robot motion is identical, each time the toolpath is executed, by adding a MoveJ with a **Use Joint Angles** set to move to a fixed joint configuration before executing the toolpath. See 4.7.1 Move on page 85

Regular TCPSimilar to configuring a Remote TCP Toolpath Move, a regular TCP Toolpath Move requires<br/>the following:

Moves

- Toolpath file
- Regular TCP
- Plane Feature as a PCS

ConfiguringThis is similar to configuring a Toolpath (see Configuring a Toolpath using CAD/CAMand ImportingSoftware on page 164) and importing Toolpath (see Importing a G-code Toolpath intoa Toolpath FilePolyScope on page 164).

Configuring a Regular TCP

- Follow the instructions to configure a Regular TCP.
- Verify the positive Z-axis of the tool points away from the part surface.

Configuring a Plane Feature PCS

- 1. Create a plane feature by Adding a plane or Teaching a plane. See .
- 2. Fix the part relative to the robot base.
- 3. Verify the correct TCP is us to create the plane feature. For high accuracy, temporarily set up a sharp Remote TCP to complete this teaching process.
- 4. Jog the robot for the Remote TCP to touch the origin, positive X-axis and the positive Y-axis direction of the PCS on the part.
- 5. Finish the teaching process and confirm the PCS position and orientation.

## Configuring a Toolpath Node

- 1. Access the Program Tab and tap URCaps.
- Select a TCP and set the motion parameters: tool speed, tool acceleration and blend radius. Select Spin tool freely around its Z-axis. Do not select if the tool must follow the orientation around Z-axis defined in the toolpath file.
- 3. Tap +Toolpath to insert a Toolpath node.
- 4. In the drop-down menu, select a toolpath file and the corresponding PCS (Plane Feature).
- 5. Adjust the motion parameters if different values are to be applied to the Toolpath node.
- 6. Tap Move to First Point to verify the tool can move to the first point of the toolpath.
- 7. Run the program in the simulation mode, at a low speed, to confirm the configurations are correct.

### NOTICE

You can ensure the robot motion is identical, each time the toolpath is executed, by adding a MoveJ with a **Use Joint Angles** set to move to a fixed joint configuration before executing the toolpath. See 4.7.1 Move on page 85

## 5. Installation Tab

Description

The Installation Tab allows you to configure the settings which affect the overall performance of the robot and PolyScope.

## 5.1. TCP Configuration

motion, the TCP moves linearly.

### Description

A **Tool Center Point** (TCP) is a point on the robot's tool. Each TCP contains a translation and a rotation relative to the center of the tool output flange. When programmed to return to a previously stored waypoint, a robot moves the TCP to the position and orientation saved within the waypoint. When programmed for linear

~	General	Tool Cer	nter Point			TCP Visuali	zation		
	тср	Ø	TCP 🗖	-	+ 💼				
	! Payload	V	<b>, 10</b>						4
1	Mounting	Positio	n						
i	I/O Setup	Х	0.0 mm					_	
1	Tool I/O	Y	0.0 mm	Ž	<sup>?</sup> Measure				
1	Variables	Z	0.0 mm						T
ł	Startup								
1		Orienta	ation				- "P-		
	Smooth Transition	Units	Rotation Vector [rad]	•			•		
i	Home								
1	Conveyor	RX	0.0000						
	Tracking	RY	0.0000	1	<sup>?</sup> Measure				
	Screwdriving	RZ	0.0000			Tool Flange			
>	Safety							t <sup>y</sup>	¢Ÿ
>	Features								
>	Fieldbus							X	z
>	URCaps								

PositionThe X, Y, Z coordinates specify the TCP position. When all values (including<br/>orientation) are zero, the TCP coincides with the center point of the tool output<br/>flange and adopts the coordinate system depicted on the screen.

Orientation The RX, RY, RZ coordinate boxes specify the TCP orientation. Similar to the Move Tab, use the Units drop down menu above the RX, RY, RZ boxes to select the orientation coordinates

Adding,	You can start configuring a new TCP with the following actions:
Renaming, Modifying and Removing TCPs	<ul> <li>Tap the + to define a new TCP with a unique name. The new TCP is available in the dropdown menu.</li> <li>Tap the / to rename a TCP.</li> <li>Tap the in to remove a selected TCP. You cannot remove the last TCP.</li> </ul>
	When moving linearly, the robot always uses the active TCP to determine the TCP offset. The active TCP can be changed using a Move command (see 4.2.2 Command Tab on page 71) or a Set command. The motion of the active TCP is visualised on the Graphics Tab (see 4.2.3 Graphics Tab on page 74).
Default TCP	<ul><li>The Default TCP must be set as the active TCP before running a program.</li><li>Select the desired TCP and tap Set as default to set a TCP as the default.</li></ul>
	The green icon in the available drop-down menu indicates the default configured TCP.

orientation

## 5.1.1. Teaching TCP Position

Teaching TCP TCP position coordinates can be calculated automatically as follows:

- 1. Tap Measure.
- 2. Choose a fixed point in the workspace of the robot.
- 3. Use the position arrows on the right side of the screen to move the TCP from at least three different angles and to save the corresponding positions of the tool output flange.
- 4. Use the **Set** button to apply the verified coordinates to the appropriate TCP. The positions must be sufficiently diverse for the calculation to work correctly. If they are not sufficiently diverse, the status LED above the buttons turns red.

<b>I</b> Run	Frogram Installation		
🗸 Ger	neral	Tool Center Point	Teach TCP Orientation
	ТСР		No feature has been selected
-	Payload	Position	-
n I	Mounting	X 0.0 mm	Choose a feature and set a point with the tool pointing in the direction of the Z axis of the selected feature.
I	I/O Setup	Y 0.0 mm <b>%</b> Measure	<undefined> ▼</undefined>
1	Tool I/O	Z 0.0 mm	
١	Variables	2 0.0	Set point
S	Startup		
	Smooth Transition	Orientation Units Rotation Vector [rad]

💙 Safe	ety		
📏 Fea	itures		
> Fiel	dbus		
> URC	Caps		
		]	
() №	lormal	Spee	

Though three positions are sufficient to determine the TCP, a fourth position can be used to further verify the calculation is correct. The quality of each saved point, with respect to the calculated TCP, is indicated using a green, yellow, or red LED on the corresponding button.

- 1. Tap Measure.
- Select a feature from the drop-down list. (See 5.14 Features on page 192) for additional information on defining new features
- 3. Tap **Set point** and use **Move tool arrows** to a position where the tool's orientation and the corresponding TCP coincide with the selected features's coordinate system.
- 4. Verify the calculated TCP orientation and apply it to the selected TCP by tapping **Set**.

## 5.2. Payload

### Description

You must set the Payload, the CoG and the inertia for the robot to perform optimally. You can define multiple Payloads, and switch between them in your program. This is useful in Pick and Place applications, for example, where the robot picks up and releases an object.

Run Program Installation			PROGRAM < Installation de		Open Save	<u>دددد</u> <b>=</b>
✔ General	Payload			Payload Visua	lization	
ТСР	🖉 🗸 Paylo	ad 🔻	<b>+</b> în			
🔥 Payload						+

> URCaps	lnertia given with orig tool flange axes.	in in the CoG and the	axes aligned with the			
Normal			Speed	100%	D C	Simulation

Adding, Renaming, Modfying and Removing Payloads	<ul> <li>You can start configuring a new Payload with the following actions:</li> <li>Tap the + to define a new Payload with a unique name. The new payload is available in the drop-down menu.</li> <li>Tap the 1 to rename a Payload.</li> <li>Tap the 1 to remove a selected Payload. You cannot remove the last Payload.</li> </ul>
Active Payload	The checkmark in the drop-down indicates which payload is active region . The active Payload can be changed using the Set Now.
Default Payload	<ul> <li>The default Payload is set as the active Payload before the program starts.</li> <li>Select the desired Payload and tap Set as default to set a Payload as the default.</li> <li>The green icon in the drop-down menu indicates the default configured Payload</li> </ul>
Setting the Center of Gravity	Tap the fields $CX$ , $CY$ and $CZ$ to set the center of gravity. The settings apply to the selected Payload.

Payload Estimation	This feature allows the robot to help set the correct Payload and Center of Gravity (CoG).					
Using the Payload	<ol> <li>In the Installation Tab, under General, select <b>Payload</b>.</li> <li>On the Payload screen, tap <b>Measure</b>.</li> </ol>					
Estimation	3. In the Payload Estimation Wizard tap <b>Next</b> .					
Wizard	<ol> <li>Follow the steps in the Payload Estimation Wizard to set the four positions. Setting the four positions requires moving the robot arm into four different positions. The load of the payload is measured at each position.</li> </ol>					
	5. Once all measurements are complete, you can verify the result and tap <b>Finish</b> .					
	NOTICE     Follow the these guidelines for best Payload Estimation results:					
	<ul> <li>Ensure the TCP positions are as different as possible from each other</li> </ul>					
	Perform the measurements within a short timespan					

- Avoid pulling on the tool and/or attached payload before and during estimation
- Robot mounting and angle must be correctly defined in the installation

Setting Inertia Values You can select Use custom Inertia Matrix to set inertia values.

Tap the fields: IXX, IYY, IZZ, IXY, IXZ and IYZ to set the inertia for the selected Payload.

The inertia is specified in a coordinate system with the origin at the Center of Gravity (CoG) of the payload and the axes aligned with the tool flange axes.

The default inertia is calculated as the inertia of a sphere with the user specified mass, and a mass density of  $1g/cm^3$ 

## 5.3. Mounting

Description

Specifying the mounting of the robot arm serves two purposes:

- 1. To make the robot arm appear correctly on the PolyScope screen.
- 2. To tell the controller about the direction of gravity.

### WARNING

Failure to mount the robot arm correctly can result in frequent stops.

### WARNING

Verify and use the correct installation settings. Save and load the installation files with the program.

If the robot arm is mounted in one of the ways listed below, adjustment is required.

- ceiling mounted
- wall mounted
- mounted at an angle

On the Robot Mounting and Angle screen, use the buttons on the right to set the angle of the robot arm mounting. The first three buttons set the angle as follows:

- ceiling (180°)
- wall (90°)
- floor (0°)

The **Tilt** buttons set an arbitrary angle.

Use the buttons on the lower part of the screen to rotate the mounting of the Robot arm to match the actual mounting.

An advanced dynamics model gives the robot arm smooth and precise motions and allows the robot arm to hold itself in Freedrive. For this reason, it is important to mount the robot arm correctly.

## 5.4. I/O Setup

Description

Use the I/O Setup screen to define I/O signals and configure actions with the I/O tab control. The types of I/O signals are listed under **Input** and **Output**.

You can use a fieldbus, for example, Profinet and EtherNet/IP, to access the general purpose registers.

If you enable the Tool Communication Interface (TCI), the tool analog input becomes unavailable.

General	View								
TCP	Digital		▼						
Payload

Safety	Rename					I/O tab cor	ntrol		
Features				Clear				-	
Fieldbus	Action in pr	rogram							
URCaps	High wher	running-low when	stopped		•				

### NOTICE

When starting programs from an I/O or fieldbus input, the robot can begin movement from the position it has, there will not be any manual movement to the first waypoint via PolyScope required.

## I/O SignalTo limit the number of signals listed under Input and Output, use the View drop-down menuTypeto change the displayed content based on signal type.

Assigning User-defined Names	You can name the Input and Output signals to easily identify the ones being used. 1. Select the desired signal.
	2. Tap the text field to type a name for the signal.
	3. To reset the name to default, tap <b>Clear</b> .
	You must provide a user-defined name for a general purpose register to make it available in

You must provide a user-defined name for a general purpose register to make it available in the program (i.e., for a **Wait** command or the conditional expression of an **If** command). The **Wait** and **If** commands are described in (4.7.4 Wait on page 117) and (4.8.4 If on page 133), respectively. You can find named general purpose registers in the **Input** or **Output** selector on the **Expression Editor** screen.

I/O Actions	You can use Physical and Fieldbus digital I/Os to trigger actions or react to the status of a
and I/O Tab	program.
Control	

I/O Tab Use I/O Tab Control to specify whether an output is controlled on the I/O tab (by either programmers, or both operators and programmers), or if it is controlled by the robot programs.

### Available Input Actions

Command	Action	
Start	Starts or resumes the current program on a rising edge (only enabled in Remote Control)	
Stop	Stops the current program on a rising edge	
Pause	Pauses the current program on a rising edge	
Freedrive	When the input is high, the robot goes into freedrive (similar to the freedrive button). The input is ignored if other conditions disallow freedrive.	

### WARNING

If the robot is stopped while using the Start input action, the robot slowly moves to the first waypoint of the program before executing that program. If the robot is paused while using the Start input action, the robot slowly moves to the position from where it was paused before resuming that program.

Available Output Actions

Action	Output state	Program state
Low when not running	Low	Stopped or paused
High when not running	High	Stopped or paused
High when running, low when stopped	Low High	Running, Stopped or paused
Low on unscheduled stop	Low	Program terminated unscheduled
Low on unscheduled stop, otherwise High	Low High	Program terminated unscheduled Running, stopped or paused
Continuous Pulse	Alternates between high and low	Running (pause or stop the program to maintain the pulse state)

Program Termination Cause An unscheduled program termination can occur for any of the reasons listed below:

- Robot stop
- Fault
- Violation
- Runtime exception

# 5.5. Installation Variables

#### Description

Variables created on the **Installation Variables** pane are called installation variables and are used like normal program variables. Installation variables are distinct because they keep their value even if a program stops then starts again, and when the robot arm and/or Control Box is powered down and powered up again.

			M <unnamed>*</unnamed>	
✓ General TCP	Installation	Variables		
🕐 Payload	★ Name	▲ Value	<ul> <li>Description</li> </ul>	▶
Mounting				^
I/O Setup				
Tool I/O				
Variables				
Startup				
Smooth Transition				
Home				
Conveyor Tracking				
Screwdriving				~
> Safety				
> Features				Create New Delete
> Fieldbus	Name	Value	Des	cription
> URCaps		1=		
	☐ Fa∨orite ∨ariable			OK Cancel
O Normal		<u> </u>	Speed 100%	Simulation

Creating installation variables Installation variable names and values are stored with the installation, so you can use the same variable in multiple programs.

Installation variables and their values are saved automatically every 10 minutes during program execution, also when the program is paused and when it is stopped.

To create an installation variable

- Tap Create New and a new variable name is suggested in the Name field. You can edit the variable name as desired.
- 2. In the **Value** field, set a value for the new variable.

You cannot save a variable without first setting the Value.

- 3. You can describe the new installation variable in the Description field.
- 4. You can set the new variable as favorite by checking the Favorite variable box.
- 5. Tap **OK** to add the new variable to the Installation Variables list.

Designating favorite installation variables	<ul> <li>Designating a favorite installation variable allows the installation variable to be part of the set of favorite variables displayed when you select it to only show favorite variables on the Variables tab in the Program Tab screen and on the Run Tab screen.</li> <li>To designate an installation variable as favorite <ol> <li>In the Header, tap Installation.</li> <li>Under General, select Variables.</li> <li>Select the desired variables.</li> <li>Check the Favorite variable box.</li> </ol> </li> <li>Tap Run to return to your variable display.</li> </ul>
Managing installation variables	<ul> <li>To edit installation variables</li> <li>1. Select the desired variable in the Installation Variables list.</li> <li>2. You can edit the Value, the Description, or the Favorite variable. You cannot edit the variable name in this step.</li> <li>Changes to edited installation variables take immediate effect. To delete installation variables</li> <li>1. Select the desired variable and tap Delete.</li> <li>2. Select Delete Variable in the confirmation pop-up</li> </ul>
Variable descriptions	<ul> <li>You can add information to your variables by adding variable descriptions in the Description column. You can use the variable descriptions to convey the purpose of the variable and/or the meaning of its value to operators using the Run tab screen and/or other programmers.</li> <li>Variable descriptions (if used) can be up to 120 characters, displayed in the Description column of the variables list on the Run tab screen and the Variables tab screen. A variable description spans multiple lines to fit the width of the Description column if necessary. You can also collapse and expand the Description column by using the buttons shown below.</li> <li>To collapse/expand the Description column.</li> <li>1. Tap Collapse to collapse the Description column.</li> <li>2. Tap Expand to expand the Description column.</li> </ul>

# 5.6. Startup

Description

The Startup screen contains settings for automatically loading and starting a default program, and for auto-initializing the Robot arm during power up.

✓ General	Changes do not take effect until saving the installation
тср	Default Program File
! Payload	Automatically load a default program when the robot is turned on
Mounting	Load default program:
I/O Setup	<select default="" program=""></select>
Tool I/O	hat the block has been and the Dum Tab
Variables	Auto Start the default program in the Run Tab On <pre> visit content of the Run Tab On </pre>
Startup	
Smooth Transition	1. If the Auto Initialize option below is enabled too, the robot can start moving on power up.
Home	This is only available in Remote Control Mode.
Conveyor	Auto Initialize
Tracking	Automatically initialize the robot if the arm is powered off
Screwdriving	
Safety	Auto brake release the robot
Features Fieldbus	On < <u>Di.Input&gt;</u> edge to Low
, WA	RNING
7	<ol> <li>When autoload, auto start and auto initialize are enabled, the robot runs the program as soon as the Control Box is powered u as long as the input signal matches the selected signal level. Fo example, the edge transition to the selected signal level will not be required in this case.</li> </ol>
:	<ol> <li>Use caution when the signal level is set to LOW. Input signals an low by default, leading the program to automatically run without being triggered by an external signal.</li> </ol>
:	<ol> <li>You must be in <b>Remote Control</b> Mode before running a progran where auto start and auto initialize are enabled.</li> </ol>

Loading a Startup Program

A default program is loaded after the Control Box is powered up. Furthermore, the default program is auto loaded when the **Run Program** screen (see 3 Run Tab on page 57) is entered and no program is loaded.

Starting aThe default program is auto started in the Run Program screen. When the default programStartupis loaded and the specified external input signal edge transition is detected, the program isProgramstarted automatically.

On Startup, the current input signal level is undefined. Choosing a transition that matches the signal level on startup starts the program immediately. Furthermore, leaving the **Run Program** screen or tapping the Stop button in the Dashboard disables the auto start feature until the Run button is pressed again.

# 5.7. I/O Interface Control

Description

The I/O Interface Control allows you to switch between user control and URcap control.

🖊 General	I/O Interface Control					
TCP	Select how the Tool I/O i	nterface is controlled. If a UR	.Cap contr	ols the interface, user defined o	ptions will be overridden.

Fieldbus	RX Idle Chars	1	.5	Digital Output 1	Sinking (NPN)	
	TX Idle Chars	3	.5			
> URCaps						

I/O Interface Control

- 1. Tap the Installation tab and under General, tap Tool I/O
- Under I/O Interface Control, select User to access the Tool Analog Inputs and/or Digital Output Mode settings. Selecting a URCap removes access to the Tool Analog Inputs and the Digital Output Mode settings.

### NOTICE

If a URCap controls an end-effector, such as a gripper, then the URCap requires control of the Tool IO Interface. Select the URCap in the list, to allow it to control the Tool IO Interface.

### 5.7.1. Analog Input - Communication Interface

Description	The Tool Communication Interface (TCI) enables the robot to communicate with an attached tool via the robot tool analog input. This removes the need for external cabling. Once the Tool Communication Interface is enabled, all tool analog inputs are unavailable					
ΤοοΙ	1. Tap the Installation tab and under General tap Tool I/O.					
Communication Interface	<ol> <li>Select Communication Interface to edit TCI settings. Once the TCI is enabled, the tool analog input is unavailable for the I/O Setup of the Installation and does not appear in the input list. Tool analog input is also unavailable for programs as Wait For options and expressions.</li> </ol>					
	<ol> <li>In the drop-down menus under Communication Interface, select required values. Any changes in values are immediately sent to the tool. If any installation values differ from what the tool is using, a warning appears.</li> </ol>					
Description	The tool communication interface allows two digital outputs to be independently configured. In PolyScope, each pin has a drop-down menu that allows the output mode to					
	be set. The following options are available:					
	<ul> <li>Sinking: This allows the pin to be configured in an NPN or Sinking configuration. When the output is off, the pin allows a current to flow to the ground. This can be used in conjunction with the PWR pin to create a full circuit.</li> </ul>					
	<ul> <li>Sourcing: This allows the pin to be configured in a PNP or Sourcing configuration. When the output is on, the pin provides a positive voltage source (configurable in the IO Tab). This can be used in conjunction with the GND pin to create a full circuit.</li> </ul>					
	<ul> <li>Push / Pull: This allows the pin to be configured in a Push / Pull configuration.</li> <li>When the output is on, the pin provides a positive voltage source (configurable in IO Tab). This can be used in conjunction with the GND pin to create a full circuit When the output is off, the pin allows a current to flow to the ground.</li> </ul>					

After selecting a new output configuration, the changes take effect. The currently loaded installation is modified to reflect the new configuration. After verifying the tool outputs are working as intended, make sure to save the installation to prevent losing changes.

Dual PinDual Pin Power is used as a source of power for the tool. Enabling Dual Pin Power disablesPowerdefault tool digital outputs.

# 5.8. Hardware

Description

In the hardware tab, you can see and select the hardware that is available to you. Some URCap may be enabled or disabled here. Any URCap safety equipment will affect the safety checksum.

🕸 🗐 🏟 🞜 👪 🔝 🚯	8 🗄				10.54.2	53.81

# URCap safety equipment

A deactivation of a Safety URCap disconnects that Safety URCap and its related hardware (if given) from all safety and other functional procedures of the robot. Program nodes of a deactivated Safety URCap will remain within the robot program but may not be functional any more.

# 5.9. Smooth Transition

Description When switching between safety modes during events (i.e., Reduced Mode Input, Reduced Mode Trigger Planes, Safeguard Stops, and Three-Position Enabling Device), the Robot Arm aims to use 0.4s to create a "soft" transition. Existing applications have unchanged behavior which corresponds to the "hard" setting. New installation files default to the "soft" setting.

Adjusting Acceleration/Deceleration Settings

- 1. In the Header, tap Installation.
- 2. In the In the Side Menu on the left, under **General**, select **Smooth Transition**.
- 3. Select **Hard** to have a higher acceleration/deceleration or select **Soft** for the smoother default transition setting.

## 5.10. Home

#### Description

Home is a user-defined return position for the Robot Arm. Once defined, the Home Position is available when creating a robot program. You can use the Home Position to define a Safe Home Position. (See 2.9 Safe Home Position on page 55) Use the Home screen buttons for the following:

- Edit Position modifies a Home Position.
- Move here moves the Robot Arm to the defined Home Position.
- Zero Position returns the Robot Arm to an upright position.

General	Home		Robot		
TCP					
👖 Payload	Edit Posi	tion			
Mounting	Move he				
I/O Setup		i e			
Tool I/O	Zero Po	sition

Conveyor Tracking	Joint Position		í .		
Screwdriving	Base	90.00°			
Safety	Shoulder	-90.00°			
> Features	Elbow	-90.00°			
Fieldbus	Wrist 1	-90.00°			
VRCaps	Wrist 2	90.00°			
	Wrist 3	0.00°			

#### Defining Home

- 1. In the Header, tap Installation.
- 2. Under General, select Home.
- 3. Tap Set Position.
- 4. Teach robot using either Freedrive or Transition buttons.

# 5.11. Conveyor Tracking Setup

Description	The Conveyor Tracking Setup allows the movement of up to two separate conveyors to be configured. The Conveyor Tracking Setup provides options for configuring the robot to work with absolute or incremental encoders, as well as linear or circular conveyors.				
Defining a Conveyor	<ol> <li>In the Header, tap Installation.</li> <li>Under General, select Conveyor Tracking.</li> </ol>				
Conveyor	<ol> <li>Under Conveyor Tracking Setup, in the dropdown list select Conveyor 1 or Conveyor 2. You can only define one conveyor at a time.</li> </ol>				
	4. Select Enable Conveyor Tracking				
	5. Configure Conveyor Parameters and Tracking Parameters.				
Conveyor Parameters	Incremental Encoders These can be connected to Digital Inputs 8 to 11. Decoding of digital signals runs at 40kHz. Using a <b>Quadrature</b> encoder (requiring two inputs), the robot can determine the speed and direction of the conveyor. If the direction of the conveyor is constant, a single input can be used to detect <i>Rising</i> , <i>Falling</i> , or <i>Rise and Fall</i> edges which determine conveyor speed.				
	Absolute Encoders These can be connected through a MODBUS signal. This requires a Digital MODBUS				

Output register preconfigured in (section ).

### Tracking Linear Conveyors

Parameters

When a linear conveyor is selected, a line feature must be configured in the **Features** part of the installation to determine the direction of the conveyor. Ensure accuracy by placing the line feature parallel to the direction of the conveyor, with a large distance between the two points that define the line feature. Configure the line feature by placing the tool firmly against the side of the conveyor when teaching the two points. If the line feature's direction is opposite to the conveyor's movement, use the **Reverse direction** button. The **Ticks per meter** field displays the number of ticks the encoder generates when the conveyor moves one meter.

### Circular Conveyors

When tracking a circular conveyor, the conveyor center point must be defined.

- 1. Define the center point in the **Features** part of the installation. The value of **Ticks per revolution** must be the number of ticks the encoder generates when the conveyor rotates one full revolution.
- 2. Select the **Rotate tool with conveyor** checkbox for the tool orientation to track the conveyor rotation.

# 5.12. Screwdriving Setup

#### Description

The Screwdriving Setup provides options for configuring the robot to work with an industrial screwdriver or an industrial nutrunner. You can setup the screwdriver's position with respect to the robot's tool flange and electrical interface.

<b>I</b> Run	Program		PROGRAN	// <unnamed> 🛄 🛅 // default* New Open</unnamed>	50ve	$\Xi$
$\sim$	General	Screwdriving				
	TCP Payload Mounting I/O Setup Tool I/O Variables	Screwdriving Setup Use the TCP page to configu	ure the TCP at the tip of the s tion. Use the graphics on the orientation			x
	Startup	I/O Signals	Input	Output	Z	
	Smooth Transition Home	Interface	OK Select	Program Selection 1 Select	▼ Start	•
1	Conveyor Tracking		Not OK	Program Selection 2	Program Sele	
	Screwdriving		Select	▼ Select	▼ 1.0	s
>	Safety		Ready	Program Selection 3		
· >	eatures		Select	▼ Select	•	
>	-ieldbus			Program Selection 4		
>	JRCaps			Select	<b>▼</b>	
C	Normal		Sp	eed 100%		Simulation

Configuring aIn any output Program Selection list under Output, you can select an integer output toScrewdriverswitch Program Selection to a number field.

- 1. In the Header, tap Installation.
- 2. Under General, select **Screwdriving**, or create your own TCP for screwdriving by tapping **TCP** under General.
- 3. Under Input and Output, configure the I/Os for your screwdriver. You can use the Interface list to filter the type of I/Os displayed under Input and Output.
- 4. Under Start, select the I/O that starts the screwdriving action.

Configuring the Screwdriver Position

- Under Screwdriving Setup, use the drop-down menu to select a previously defined TCP (see 5.1 TCP Configuration on page 170) where Position and Orientation are set up as follows:
  - Configure the Position to be the tip of the screwdriver tool where it contacts the screw.
  - Configure the Orientation so that the positive Z direction is aligned to the length of the screws to be tightened.

You can visualize the X, Y and Z coordinates of the selected TCP to confirm it matches the tool's bit or socket.

The Screwdriving program node uses the positive Z direction of the selected TCP to follow the screw and calculate distances.

Configuring the Screwdriver Interface

- 1. Use the **Interface** drop-down menu at the top of the screen to change the displayed content based on signal type.
- 2. Under Input, configure the signals that the robot receives from the screwdriver:
  - OK: High when tightening ends successfully, if not selected this condition is not available in the Screwdriving program node
  - Not OK: High when tightening ends with errors, if not selected this condition is not available in the Screwdriving program node
  - Ready: High when the screwdriver is ready to be started, if not selected this condition is not checked
- 3. Under Output configure the signals that the robot sends to the screwdriver:
  - Start: starts the tool tightening or loosening a screw depending only on wiring.
  - Program Selection: one integer, or up to four binary signals, can be selected to activate different tightening configurations stored in the screwdriver
  - Program Selection Delay: wait time to be used after changing the screwdriver's program to make sure it is active

Typical Orientation values

Values (in Rotation Vector [rad] notation) are illustrated in the table below.

	Orientation
Screwdriving axis parallel to the negative Y direction of the robot's tool flange1	<ul> <li>RX: 1.5708 rad</li> <li>RY: 0.0000 rad</li> <li>RZ: 0.0000 rad</li> </ul>
Screwdriving axis parallel to the positive Y direction of the robot's tool flange2	<ul> <li>RX: -1.5708 rad</li> <li>RY: 0.0000 rad</li> <li>RZ: 0.0000 rad</li> </ul>
Screwdriving axis parallel to the positive X direction of the robot's tool flange3	<ul> <li>RX: 0.0000 rad</li> <li>RY: 1.5708 rad</li> <li>RZ: 0.0000 rad</li> </ul>
Screwdriving axis parallel to the negative X direction of the robot's tool flange4	<ul> <li>RX: 0.0000 rad</li> <li>RY: -1.5708 rad</li> <li>RZ: 0.0000 rad</li> </ul>
Screwdriving axis parallel to the positive Z direction of the robot's tool flange5	<ul> <li>RX: 0.0000 rad</li> <li>RY: 0.0000 rad</li> <li>RZ: 0.0000 rad</li> </ul>
Screwdriving axis parallel to the negative Z direction of the robot's tool flange6	<ul> <li>RX: 3.1416 rad</li> <li>RY: 0.0000 rad</li> <li>RZ: 0.0000 rad</li> </ul>

# 5.13. Safety

Description

See chapter: 2 Software Safety Configuration on page 28.

# 5.14. Features

### Description

A **Feature** represents an object defined by a six dimensional pose (position and orientation) relative to the robot base. You can name a feature for future reference. Some subparts of a robot program consist of movements executed relative to specific objects other than the base of the robot arm. These objects can be tables, other machines, workpieces, vision systems, blanks, or boundaries existing around the robot arm.

The robot includes two predefined features, listed below, with poses defined by the configuration of the robot arm itself:

- The Base feature is located with origin in the centre of the robot base.
- The Tool feature is located with origin in the centre of the current TCP.

Detail

Use the Point feature, Line feature and/or Plane feature to define a feature pose. These features are positioned through a method that uses the current pose of the TCP in the work area. So you can teach feature locations using Freedrive, or "jogging" to move the robot to the desired pose.

Selecting a feature depends on the type of object being used and the precision requirements. Use the Line feature and Plane feature where possible as they are based on more input points. More input points mean higher precision.

For example, you can accurately define the direction of a linear conveyor, by defining two points of a Line feature with as much physical separation as possible. You can also use the Point feature to define a linear conveyor, however, you must point the TCP in the direction of the conveyor's movement.

Using more points to define the pose of a table means that the orientation is based on the positions rather than the orientation of a single TCP. A single TCP orientation is harder to configure with high precision.

For more on adding features, see (sections: Adding a Point on page 195) and ( Plane Feature on page 196).

Using a Feature	<ul> <li>You can refer to a feature defined the installation from the robot program, to relate robot movements (e.g. MoveJ, MoveL and MoveP commands) to the feature (see section 4.7.1 Move on page 85).</li> <li>This allows for easy adaptation of a robot program when for example: there are multiple robot stations, when an object is moved during program runtime, or when an object is permanently moved in the scene. Adjusting the feature of an object, adjusts all program movements relative to the object accordingly.</li> <li>For further examples, see sections: (Example: Manually Updating a Feature to Adjust a Program on page 198) and (Example: Dynamically Updating a Feature Pose on page 199). When a feature is chosen as a reference, the Move Tool buttons for translation and rotation operate in the selected feature space (see 6 Move Tab on page 207) and (To use the Move Tool arrows on page 207), reading of the TCP coordinates. For example, if a table is defined as a feature and is chosen as a reference in the Move Tab, the translation arrows (i.e., up/down, left/right, forward/backward) move the robot in these directions relative to the table.</li> <li>In the Features tree you can rename a Point, Line or Plane by tapping the pencil button.</li> <li>In the Features tree you can delete a Point, Line or Plane by tapping the Delete button.</li> </ul>
Using	Tap <b>Move here</b> to move the robot arm towards the selected feature. At the end of this movement, the coordinate systems of the feature and the TCP will coincide.
Move here	<b>Move here</b> is disabled if the robot arm cannot reach the feature.
Point	The point feature defines a safety boundary or a global home configuration of the Robot arm.
feature	The point feature pose is defined as the position and orientation of the TCP.

**Line feature** The line feature defines lines that the robot needs to follow. (e.g., when using conveyor tracking). A line *I* is defined as an axis between two point features *p1* and *p2* as shown in figure 5.14.

- Adding a Line
- 1. In Installation, select Features.

Under Features select Line.

Here you can see the axis directed from the first point towards the second point, constitutes the y-axis of the line coordinate system. The z-axis is defined by the projection of the z-axis of p1 onto the plane perpendicular to the line. The position of the line coordinate system is the same as the position of p1.

Plane Select the plane feature when you need a frame with high precision: e.g., when working with Feature a vision system or doing movements relative to a table. 1. In Installation, select Features. Adding a plane

2. Under Features select Plane.

Teaching aWhen you press the plane button to create a new plane, the on-screen guide assists youplanecreating a plane.

- 1. Select Origo
- 2. Move robot to define the direction of the positive x-axis of the plane
- 3. Move robot to define the direction of the positive y-axis of the plane

The plane is defined using the right hand rule so the z- axis is the cross product of the x-axis and the y-axis, as illustrated below.

### NOTICE

You can re-teach the plane in the opposite direction of the x-axis, if you want that plane to be normal in the opposite direction.

Modify an existing plane by selecting Plane and pressing Modify Plane. You will then use the same guide as for teaching a new plane.

#### 

Example: Manually Updating a Feature to Adjust a Program	Consider an application where multiple parts of a robot program is relative to a table. The figure below illustrates the movement through waypoints from wp1 to wp4.
	Robot Program MoveJ S1 MoveL # Feature: P1_var wp1 wp2 wp3 wp4
	si wp1 wp2 wp3 +++++++++++++++++++++++++++++++++++

14.1: Simple program with four waypoints relative to a feature plane manually updated by changing the feature

#### 14.2:

The application requires the program to be reused for multiple robot installations where the position of the table varies slightly. The movement relative to the table is identical. By defining the table position as a feature *P1* in the installation, the program with a *MoveL* command configured relative to the plane can be easily applied on additional robots by just updating the installation with the actual position of the table.

The concept applies to a number of Features in an application to achieve a flexible program can solve the same task on many robots even though if other places in the work space varies between installations.

Consider a similar application where the robot must move in a specific pattern on top of a Dynamically table to solve a particular task.

#### A MoveL command with four waypoints relative to a plane feature

```
Robot Program
    MoveJ
        wp1
    y = 0.01
    o = p[0, y, 0, 0, 0]
    P1 var = pose trans(P1 var, o)
    MoveL # Feature: P1 var
        wp1
        wp2
        wp3
        wp4
```

14.3: Applying an offset to the plane feature

14.4:

Robot Program MoveJ S1 if (digital input[0]) then Pl var = Pl else P1 var = P2 MoveL # Feature: P1 var wp1 wp2 wp3 wp4

Example:

Updating a Feature Pose

wp:

**S**1

wn4

### 5.14.1. Feature Edit

**Description** The Feature Edit is an alternative way to add features to your installation and/or edit existing features.

Use Edit to place and move features without moving the robot arm, so the feature can be placed outside of the robot arm's reach.

Editing a You can edit a defined point or an undefined point. Editing an undefined point defines it.

- Point
- 1. In Installation, tap Features.
- 2. Under Features, select **Point** to add a point to your program tree.
- 3. Tap **Edit** to access the Edit screen to make changes to the position and rotation of the point

Editing a The line appears as two points in your program tree. You must define each point.

- 1. In Installation, tap Features.
  - 2. Under Feature, select Line to add a line to your program tree.
  - 3. The line is made up of two points:
    - Tap one point to edit those coordinates, then tap the other line point to edit those coordinates.

Editing a Plane

Line

- 1. In Installation, tap Features.
- 2. Under Feature, select Plane to add a plane to your program tree.
- 3. Tap **Edit** to access the Edit screen to make changes to the positon and rotation of the plane

### 5.15. Fieldbus

### Fieldbus

You can use the Fieldbus options to define and configure the family of industrial computer network protocols used for real-time distributed control accepted by PolyScope:

- MODBUS
- Ethernet/IP
- PROFINET
- PROFIsafe

### 5.15.1. MODBUS Client I/O Setup

### 5.15.2. EtherNet/IP

 Description
 EtherNet/IP is a network protocol that enables the connection of the robot to an industrial

 EtherNet/IP Scanner Device.
 If the connection is enabled, you can select the action that occurs when a program loses

 EtherNet/IP Scanner Device connection.
 Those actions are:

None	PolyScope ignores the loss of EtherNet/IP connection and the program continues to run.
Pause	PolyScope pauses the current program. The program resumes from where it stopped.
Stop	PolyScope stops the current program.

### 5.15.3. PROFINET

### Description

The PROFINET network protocol enables or disables the connection of the robot to an industrial PROFINET IO-Controller.

If the connection is enabled, you can select the action that occurs when a program loses PROFINET IO-Controller connection.

Those actions are:

None	PolyScope ignores the loss of PROFINET connection and the program continues to run.	
Pause	PolyScope pauses the current program. The program resumes from where it stopped.	
Stop	PolyScope stops the current program.	

If the PROFINET engineering tool (e.g. TIA portal) emits a DCP Flash signal to the robot's PROFINET or PROFIsafe device, a popup in PolyScope is displayed.

### 5.15.4. PROFIsafe

### Description

The PROFIsafe network protocol (implemented as version 2.6.1) allows the robot to communicate with a safety PLC according to ISO 13849, Cat 3 PLd requirements. The robot transmits safety state information to a safety PLC, then receives information to be reduced or to trigger a safety related function like an emergency stop.

The PROFIsafe interface provides a safe, network-based alternative to connecting wires to the safety IO pins of the robot control box.

PROFIsafe is only available on robots that have an enabling license, which you can obtain by contacting your local sales representative, once obtained, the license can be downloaded on <u>myUR</u>.

Please refer to Robot Registration and License File on page 233 for information regarding robot registration and license activation.

Advanc A control message received from the safety PLC contains the information in the table below.

#### ed Option

Signal	Description		
E-Stop by system	Asserts the system e-stop.		
Safeguard stop	Asserts the safeguard stop.		
Reset safeguard stop	Resets safeguard stop state (on low-to-high transition in automatic mode) if the safeguard stop input is cleared beforehand.		
Safeguard stop auto	Asserts safeguard stop if the robot is operating in Automatic mode. Safeguard stop auto shall only be used when a 3-Position Enabling (3PE) Device is configured. If no 3PE Device is configured, the safeguard stop auto acts as a normal safeguard stop input.		
Reset safeguard stop auto	Resets safeguard stop auto state (on low-to-high transition when in automatic mode) if safeguard stop auto inputs are cleared beforehand.		
Reduced	Activates the Reduced safety limits.		
Operational mode	Activates either manual or automatic operational mode. If the safety configuration "Operational mode selection via PROFIsafe" is disabled, this field shall be omitted from the PROFIsafe control message.		

Advan A status message sent to the safety PLC contains the information in the table below. ced

Optio

ns

Signal	Description		
Stop, cat. 0	Robot is performing, or it has completed, a safety stop of category 0; A hard stop by immediate removal of power to the arm and the motors.		
Stop, cat. 1	Robot is performing, or it has completed, a safety stop of categor 1; A controlled stop after which the motors are left in a power off state with brakes engaged.		
Stop, cat. 2	<ul> <li>Robot is performing, or it has completed, a safety stop of category</li> <li>2; A controlled stop after which the motors are left in a power on state.</li> </ul>		
Violation	Robot is stopped because the safety system failed to comply with the safety limits currently defined.		
Fault	Robot is stopped because of an unexpected exceptional error in the safety system.		
	Robot is stopped because of one of the following conditions:		
	<ul> <li>a safety PLC connected via PROFIsafe has asserted system level e-stop.</li> </ul>		
E-stop by system	<ul> <li>an IMMI module connected to the control box has asserted a system level e-stop.</li> </ul>		
	<ul> <li>a unit connected to the system e-stop configurable safety input of the control box has asserted system level e-stop.</li> </ul>		
	The robot is stopped because of one of the following conditions:		
E-stop by robot	The e-stop button of the teach pendant is pressed.		
	An e-stop button connected to the robot e-stop non- configurable safety input of the control box is pressed.		
	The robot is stopped due to one of the following conditions:		
	<ul> <li>A safety PLC connected via PROFIsafe has asserted the safeguard stop.</li> </ul>		
	<ul> <li>A unit connected to the safeguard stop non-configurable input of the control box has asserted the safeguard stop.</li> </ul>		
Safeguard stop	<ul> <li>A unit connected to the safeguard stop configurable safety input of the control box has asserted the safeguard stop.</li> </ul>		
	The signal follows the safeguard reset semantics. A configured safeguard stop reset functionality shall be used to reset this signal.		
	PROFIsafe implies use of the safeguard reset functionality.		

Advan ced	Signal	Description
Optio ns	Safeguard stop auto	The robot is stopped because it is operating in Automatic mode and because of one of the following conditions:
		<ul> <li>A safety PLC connected via PROFIsafe has asserted safeguard stop auto.</li> </ul>
		<ul> <li>A unit connected to a safeguard stop auto configurable safety input of the control box has asserted safeguard stop auto.</li> </ul>
		The signal follows the safeguard reset semantics. A configured safeguard stop reset functionality shall be used to reset this signal PROFIsafe implies use of the safeguard reset functionality
	3PE stop	Robot is stopped because it is operating in Manual mode and because of one of the following conditions:
		• You are using a 3PE TP and none of the buttons are in the middle position.
		<ul> <li>A 3-position enabling device connected to a configurable safety input of the control box has asserted the 3PE stop.</li> </ul>
	Operational mode	Indication of the current operational mode of the robot. This mode can be: Disabled (0), Automatic (1), or Manual (2).
	Reduced	Reduced safety limits are currently active.
	Active limit set	The active set of safety limits. This can be: Normal (0), Reduced (1), or Recovery (2).
	Robot moving	Robot is moving. If any joint moves at a velocity of 0.02 rad/s or higher the robot is considered in motion.
	Safe home position	Robot is at rest (robot not moving), and in the position defined as the Safe Home Position.

ConfiguringConfiguring PROFIsafe relates to programming the safety PLC, but requires minimal robotPROFIsafesetup.

- 1. Connect the robot to a trusted network that accesses a safety compliant PLC.
- 2. On PolyScope, in the Header, tap Installation.
- 3. Tap Safety, select **PROFIsafe** and configure as needed.

Run Program Installation		PROGRAM <b><unnamed>*</unnamed></b> INSTALLATION <b>default_1*</b>	New Open	Save	Manual	4D62 F209	≡
> General	PROFIsafe						
✓ Safety

Three Position							
> Features							
> Fieldbus							
💙 URCaps							
	Safety pass	word	Jnlock Lo	ck		A	pply
Power off		Speed 100%	<b>25</b> 0m	hm/s 🕨 🖸 🕻	D Simu	ulation	

### Enabling PROFIsafe

- 1. Enter the robot safety password and tap Unlock.
- 2. Use the switch button to enable PROFIsafe.
- 3. Enter a source address and destination address into the corresponding boxes.

These addresses are arbitrary numbers used by the robot and the safety PLC to identify each other.

4. You can switch the Control Operational Mode to the ON position if you want PROFIsafe to control the robot operational mode.

Only one source can control the operational mode of the robot. Therefore other sources of mode selection are disabled when operational mode selection via PROFIsafe is enabled.

The robot is now setup to communicate with a safety PLC. You cannot release the robot's brakes if the PLC is not responding or if it is misconfigured.

# 6. Move Tab

### Description

Use the Move Tab screen to move (jog) the robot arm directly, either by translating/rotating the robot tool, or by moving robot joints individually.

To use the Move Tool arrows

- Hold down any of the Move Tool arrows to move the robot arm in the corresponding direction.
  - The **Translate arrows** (upper) move the tool flange in the direction indicated.
  - The Rotate arrows (lower) change the orientation of the tool in the indicated direction. The rotation point is the Tool Center Point (TCP), i.e.the point at the end of the robot arm that gives a characteristic point on the tool. The TCP is shown as a small blue ball.

### UNIVERSAL ROBOTS

**Robot** If the current position of the TCP approaches a safety plane, a trigger plane, or the orientation of robot tool is near the tool orientation boundary limit , a 3D representation of the proximate boundary limit is shown. The visualization of boundary limits is disabled during program execution.

Safety planes display in yellow and black with an arrow indicating which side of the plane, the robot TCP is allowed to be positioned.

Trigger planes display in blue and green with an arrow indicating the side of the plane, where the **Normal** mode limits are active.

The tool orientation boundary limit is visualized with a spherical cone together with a vector indicating the current orientation of the robot tool. The inside of the cone represents the allowed area for the tool orientation (vector).

When the robot TCP is no longer in proximity of the limit, the 3D representation disappears. If the TCP is in violation or very close to violating a boundary limit, the visualization of the limit turns red.

# Feature Under Feature, you can define how to control the robot arm relative to View, Base or Tool features. For the best feel for controlling the robot arm you can select the View feature, then use Rotate arrows to change the viewing angle of the 3D image to match your view of the real robot arm.

Active TCP In the Robot field, under Active TCP, the name of the current active Tool Center Point (TCP) is displayed.

Home The Home button accesses the Move Robot into Position screen, where you can hold down the Auto button to move robot into position previously defined under Installation. The Home button's default setting returns the Robo Arm to an upright position .

**Freedrive** The on-screen **Freedrive** button allows the Robot Arm to be pulled into desired positions/poses.

Align The Align button allows the Z axis of the active TCP to align to a selected feature.

Tool PositionThe text boxes display the full coordinate values of the TCP relative to the selected feature.<br/>You can configure several named TCPs. You can also tap Edit pose to access the Pose<br/>Editor screen.Editor screen.

### Joint Position

The **Joint Position** field allows you to directly control individual joints. Each joint moves along a default joint limit range from – 360° to + 360°, defined by a horizontal bar. Once the limit is reached you cannot move a joint any further. You can configure joints with a position range different from the default, this new range is indicated with red zone inside the horizontal bar.

The Freedrive button shall only be used in applications if allowed by the risk assessment.

Using Freedrive in the Move tab

WARNING

Failure to correctly configure the mounting setting can result in unwanted robot arm movement when you use the **Freedrive** button.

- Payload settings and robot mounting settings shall be set correctly before using Freedrive.
- All personnel shall remain outside the reach of the robot arm, when **Freedrive** is in use.

### WARNING

Failure to correctly configure the installation settings, can increase the risk of the robot arm falling during **Freedrive**, due to payload errors.

- Verify the installation settings are correct (e.g. Robot mounting angle, payload mass and payload center of gravity offset). Save and load the installation files along with the program.
- Save and load the installation files along with the program.

# 6.1. Pose Editor Screen

# 7. I/O Tab

Description

Use the I/O Tab screen to monitor and set the live I/O signals from/to the Control Box.

The screen displays the current state of the I/O, including during program execution. The program stops if anything is changed during execution. At program stop, all output signals retain their states. The screen updates at 10Hz, so a very fast signal might not display properly.

Configurable I/Os can be reserved for special safety settings defined in the safety I/O configuration section of the installation (see I/O); those which are reserved will have the name of the safety function in place of the default or user defined name. Configurable outputs that are reserved for safety settings are not togglable and will be displayed as LED's only.

# Voltage When the Tool Output is controlled by the user, you can configure Voltage. Selecting a URCap removes access to Voltage.

AnalogThe analog I/O's can be set to either current [4-20mA] or voltage [0-10V] output. TheseDomainsettings are persistent over restarts of the robot controller and saved in the installation.SettingsControl over the tool I/Os could be assigned to a URCap in Tool I/O of the Installation tab.<br/>Selecting a URCap removes user's control over tool's analog I/O.

Tool

Interface

When the Tool Communication Interface TCI is enabled, the tool analog input Communication becomes unavailable. On the I/O screen, the Tool Input field appears as shown.

Tool Analog Input		
Baud Rate	115200	
Parity	None	
Stop Bits	One	
RX Idle Chars	1.50	
TX Idle Chars	3.50	

**Dual Pin power** 

When **Dual Pin Power** is enabled, the tool digital outputs must be named as follows:

- tool\_out[0] (Power)
- tool\_out[1] (GND)

Tool Digital Output
Power 🔳 🔳 GND
Current
000 mA

# 7.1. MODBUS

Description	Here, the MODBUS client (master) signals can be set up. Connections to MODBUS servers (or slaves) on specified IP addresses can be created with input/output signals				
	(registers or digital). Each signal has a unique name so it can be used in programs.				
	S deriveral     MODULS client 10 Setup     Safety     Add MODBUS Unit				
	V Fratibus  V Fratibus  IP address  ID 0.0.2 □ Sequential mode Detete Unit				
	Dependent         Type         Address         Name         Value           Unclease         Register Output         12         MODBUS_1         0         Deleter

	Add New Signal				
	Show advanced options				
	Normal Saved 2005.				
Refresh	Push this button to refresh all MODBUS connections. Refreshing disconnects all modbus				
Nellesii	units, and connects them back again. All statistics are cleared.				
Add unit	Push this button to add a new MODBUS unit.				
Delete unit	Push this button to delete the MODBUS unit and all signals on that unit.				
Set unit IP	Here the IP address of the MODBUS unit is shown. Press the button to change it.				
Sequential	Available only when Show Advanced Options selected. Selecting this checkbox forces the				
mode	modbus client to wait for a response before sending the next request. This mode is				
	required by some fieldbus units. Turning this option on may help when there are multiple				
	signals, and increasing request frequency results in signal disconnects.				
	The actual signal frequency may be lower than requested when multiple signals are defined in sequential mode. Actual signal frequency can be observed in signal statistics.				
	The signal indicator turns yellow if the actual signal frequency is less than half of the value				
	selected from the <b>Frequency</b> drop-down list.				
Add signal	Push this button to add a signal to the corresponding MODBUS unit.				
Dalata					
Delete signal	Push this button to delete a MODBUS signal from the corresponding MODBUS unit.				
aa.					

- Set Use this drop down menu to choose the signal type.
- Available types are: sig

nal

type	Digital input	A digital input (coil) is a one-bit quantity which is read from the MODBUS unit on the coil specified in the address field of the signal. Function code 0x02 (Read Discrete Inputs) is used.	
	Digital output	A digital output (coil) is a one-bit quantity which can be set to either high or low. Before the value of this output has been set by the user, the value is read from the remote MODBUS unit. This means that function code 0x01 (Read Coils) is used. When the output has been set by a robot program or by pressing the <b>set signal value</b> button, the function code 0x05 (Write Single Coil) is used onwards.	
	Register input	A register input is a 16-bit quantity read from the address specified in the address field. The function code 0x04 (Read Input Registers) is used.	
	Register output	A register output is a 16-bit quantity which can be set by the user. Before the value of the register has been set, the value of it is read from the remote MODBUS unit. This means that function code 0x03 (Read Holding Registers) is used. When the output has been set by a robot program or by specifying a signal value in the <b>set signal</b> <b>value</b> field, function code 0x06 (Write Single Register) is used to set the value on the remote MODBUS unit.	
		·	
Set signa address		the address on the remote MODBUS server. Use the on-screen keypad to nt address. Valid addresses depends on the manufacturer and configuration ODBUS unit.	
Set signa name	Set signalUsing the on-screen keyboard, the user can give the signal a name. This name is used when namenamethe signal is used in programs.		
Signal value			

SignalThis icon shows whether the signal can be properly read/written (green), or if the unit respondsconnecunexpected or is not reachable (gray). If a MODBUS exception response is received, the responsetivitycode is displayed. The MODBUS-TCP Exception responses are:status

E1	ILLEGAL FUNCTION (0x01) The function code received in the
_ ·	query is not an allowable action for the server (or slave).
	ILLEGAL DATA ADDRESS (0x02) The function code received in
	the query is not an allowable action for the server (or slave), check
E2	that the entered signal address corresponds to the setup of the
	remote MODBUS server.
	ILLEGAL DATA VALUE (0x03) A value contained in the query data
	field is not an allowable value for server (or slave), check that the
E3	entered signal value is valid for the specified address on the remote
	MODBUS server.
	SLAVE DEVICE FAILURE (0x04) An unrecoverable error occurred
E4	while the server (or slave) was attempting to perform the requested
	action.
	ACKNOWLEDGE (0x05) Specialized use in conjunction with
E5	programming commands sent to the remote MODBUS unit.
	SLAVE DEVICE BUSY (0x06) Specialized use in conjunction with
E6	programming commands sent to the remote MODBUS unit, the
	slave (server) is not able to respond now.

Show
Advanced
Options

This check box shows/hides the advanced options for each signal.

Advan ced Optio ns	Update Frequency	This menu can be used to change the update frequency of the signal. This means the frequency with which requests are sent to the remote MODBUS unit for either reading or writing the signal value. When the frequency is set to 0, then modbus requests are initiated on demand using a <i>modbus_get_signal_status</i> , <i>modbus_set_output_register</i> , and <i>modbus_set_output_signal</i> script functions.
	Slave Address	This text field can be used to set a specific slave address for the requests corresponding to a specific signal. The value must be in the range 0-255 both included, and the default is 255. If you change this value, it is recommended to consult the manual of the remote MODBUS device to verify its functionality when changing slave address.
	Reconnect count	Number of times TCP connection was closed, and connected again.
	Connection status	TCP connection status.
	Response time [ms]	Time between modbus request sent, and response received - this is updated only when communication is active.
	Modbus packet errors	Number of received packets that contained errors (i.e. invalid length, missing data, TCP socket error).
	Timeouts	Number of modbus requests that didn't get response.
	Requests failed	Number of packets that could not be sent due to invalid socket status.
	Actual freq.	The average frequency of client (master) signal status updates. This value is recalculated each time the signal receives a response from the server (or slave).

All counters count up to 65535, and then wrap back to 0.

# 7.1.1. MODBUS Client I/O

#### Description

The MODBUS Client I/O signals as they are set up in the installation. Using the dropdown menus at the top of the screen, you can change the displayed content based on signal type and MODBUS unit if more than one is configured.

Each signal in the lists contains its connections status, value, name, and signal address. The output signals can be toggled if the connection status and the choice for I/O tab control allows it.

# 8. Log Tab

Description

The Log tab displays information about the robot arm and Control Box.

Readings		Joint Load				
Controller Temp.	24.0 °C	0 Base	ОК	0.0	A 0.0 ∨	5
Main Voltage	48.0 V	1 Shoulder	ОК	2.7	a 0.0 ∨	43

IO Current	0.0 A	(4) Wrist 2	ОК	0.0		_
Tool Current	0 mA	(5) Wrist 3	OK	0.0		1-1-0
<b>iii</b> 2025-03-30 23:0	1:10	١	/iew: 🚹 🚹 😣 🔘	Clear	1	Support file
2025-03-30 23:01	1:07.743 PolyScope	COAO		^	ect an event from the Da	

Readings and Joint Load The Readings pane displays Control Box information. The Joint Load pane displays information for each robot arm joint. Each joint displays:

- Temperature
- Load
- Status
- Voltage
- **Date Log** The first column displays log entries, categorized by the severity. The second column shows a paperclip if there is an Error Report associated with the log entry. The next two columns display the messages' time of arrival and the source of the message. The last column shows a short description of the message itself.

Some log messages are designed to provide more information that is displayed on the right side, after selecting the log entry.

MessageYou can filter messages by selecting the toggle buttons that correspond to the severity of theSeveritylog entry or by whether an attachment is present. The following table describes message<br/>severity.

0	Provides general information, such as status of a program, changes of the controller and controller version.
1	Issues that may have occurred but the system was able to recover.
	A violation occurs if the safety limit is exceeded. This causes the robot to perform a safety rated stop.
8	A fault occurs if there is an unrecoverable error in the system. This causes the robot to perform a safety rated stop.

When you select a log entry, additional information appears on the right side of the screen. Selecting the attachments filter either displays entry attachments exclusively or, displays all entries.

Saving Error A detailed status report is available when a paper clip icon appears on the log line.

Reports

#### NOTICE

The oldest report is deleted when a new one is generated. Only the five most recent reports are stored.

 Select a log line and tap the Save Report button to save the report to a USB drive. You can save the report while a program is running.

You can track and export the following list of errors:

- Emergency stop
- Fault
- Internal PolyScope exceptions
- <sup>1</sup>Robot Stop
- Unhandled exception in URCap
- Violation

The exported report contains: a user program, a history log, an installation and a list of running services.

<sup>&</sup>lt;sup>1</sup>Robot stop was previously known as "Protective Stop" for Universal Robots robots.

#### Technical Support File

The report file contains information that is helpful to diagnose and reproduce issues. The file contains records of previous robot failures, as well as current robot configurations, programs and installations. The report file can be saved to external USB drive. On the Log screen, tap **Support file** and follow the on-screen instructions to access the function.

### NOTICE

The export process can take up to 10 minutes depending on USB drive speed and the size of files collected from robot file system. The report is saved as a regular zip file, that is not password protected, and can be edited before sending to technical support.

# 9. Program and Installation Manager

**Description** The Program and Installation Manager refers to three icons that allow you to create, load and configure Programs and Installations:

- New... Allows you to create a new Program and/or Installation.
- Open... Allows you to load a Program and/or Installation.
- Save... Offers saving options for a Program and/or Installation.

The File Path displays your current loaded Program name and the type of Installation. File Path changes when you create or load a new Program or Installation. You can have several installation files for a robot. Programs created load and use the active installation automatically.

PROGRAM INSTALLATION	New	Open	Save

To load	1.	In the Program and Installation Manager, tap <b>Open</b> and select Program.
---------	----	--

2. On the Load Program screen, select an existing program and tap Open.

3. In the File Path, verify that the desired program name is displayed.

а

m

progra

- To load 1. In the Program and Installation Manager, tap Open... and select Installation.
  - 2. On the Load Robot Installation screen, select an existing installation and tap Open.

3. In the Safety Configuration box, select Apply and restart to prompt robot reboot.

installat ion

an

- 4. Select Set Installation to set installation for the current Program.
  - 5. In the File Path, verify that the desired installation name is displayed.

To create a new program

- 1. In the Program and Installation Manager, tap **New...** and select Program.
- 2. On the Program screen, configure your new program as desired.
- In the Program and Installation Manager, tap Save... and select Save All or Save Program As...
- 4. On the Save Program As screen, assign a file name and tap Save.
- 5. In the File Path, verify that the new program name is displayed.

# 10. Hamburger menu

Description

The hamburger menu contains the general settings for PolyScope among these password, system and security settings.

# 10.1. About

Description

Use the About option to access and display different types of data about the robot. You can display the following types of robot data:

- General
- Version
- Legal

To display data about the robot

- 1. In the Header, tap the Hamburger menu.
- 2. Select About.
- 3. Tap **General** to access the robot's software version, network settings and serial number.

For the other data types you can:

- Tap Version to display more detailed data about the robot's software version.
- Tap Legal to display data about the robot's software license/s.
- 4. Tap Close to return to your screen.

## 10.1.1. Help

#### Description

You can access the online help description for PolyScope, the robot arm, control box and other documents that might be helpful. You can access the help via a QR code, or type the following URL in a browser: https://myur.universal-robots.com/manuals.

You can find documentation about the following:

- Robot Arm
- Control Box
- PolyScope
- Other (Service Script and Error Codes)

To find the QR code and URL

1. In the top right corner of PolyScope, tap the Hamburger dropdown menu.

Now you can scan the QR code to access help.universal-robots.com.

2. In the dropdown menu, select Help.

## ~ <unnai default 01F1 R+ 077 Help The following information is sent when scanning the OR code. Software version: 5.13.0 Robot type: UR5e Language: Int'l English Serialnumber: 20175599999 It is also possible to access the online help with this direct link: https://www.universal-robots.com/help Scan QR code Close Norma NOTICE

When you scan the QR code the following information will be sent with the QR code, and can be used in customer analytics at Universal Robots:

- PolyScope software version installed
- · Robot type and size
- Language in Polyscope
- Serial number of the robot arm

#### Software Handbook

# 10.2. Settings

To personalize	1. In the Header, tap the Hamburger menu and select Settings.
PolyScope settings	<ol> <li>In the Side Menu on the left, select an item to personalize. If an operational mode password was set, in the Side Menu, System is only available to the programmer.</li> </ol>
	3. On the bottom right, tap Apply and Restart to implement your changes.

4. On the bottom left, tap Exit to close Settings screen without changes.

# 10.2.1. Preferences

Description	Preferences contain the most basic settings, and would probably only be set once at first
	start up.

# Languages

Description	You can change the PolyScope language and measurement unit (Metric or Imperial).
-------------	--

## **Run Screen**

Description	Located at the base of the Run tab screen, the Speed Slider allows the operator to change the speed of a running Program.
To hide the Speed Slider	<ol> <li>In the Header, tap the Hamburger menu icon and select Settings.</li> <li>Under Preferences, tap Run Screen.</li> <li>Select check box to show or hide Speed Slider.</li> </ol>

Time	
Description	You can access and/or adjust the current time and date displayed on the PolyScope.
Time	<ol> <li>In the Header, tap the Hamburger menu icon and select Settings.</li> <li>Under Preferences, select Time.</li> </ol>
	3. Verify and/or adjust <b>Time</b> and/or <b>Date</b> as desired.
	4. Tap Apply and Restart to apply your changes.
D	ate and Time are displayed in the Log tab (see Date Log on page 218) under Date Log.
10.2.2. Pass	sword
Description	You can create and manage different types of password in PolyScope. An initial password must be set to access the full safety settings. The following password types are described below:
	Administrator
	Operational
Password S	ettings

To set aYou must set a password to Unlock all safety settings that make up your SafetyPasswordConfiguration. If no safety password is applied, you are prompted to set it up.

- 1. In your PolyScope header right corner, press the **Hamburger** menu and select **Settings**.
- 2. On the left of the screen, in the blue menu, press  $\ensuremath{\textbf{Password}}$  and select  $\ensuremath{\textbf{Safety}}.$
- 3. In New password, type a password.
- 4. Now, in **Confirm new password**, type the same password and press **Apply**.
- 5. In the bottom left of the blue menu, press Exit to return to previous screen.

You can press the **Lock** tab to lock all Safety settings again or simply navigate to a screen outside of the Safety menu.

Safety password	Unlock	Lock	

# 10.2.3. Accessing System and Security

**Description** The Admin password is also required to access System and Security, see 1 Administrator Password on page 1.

When you change the default password to your own password, you can use it to access the settings under System (see 10.2.4 System on page 232) and to access the settings under Security (see 10.2.5 Security on page 240).

	Settings
> Preferences	Admin Password
✓ Password	
Admin	The Admin password enables modifying system security settings
Mode	Current password
Safety	
<b>&gt;</b> System	New password
> Security	
	Confirm new password
	Activ
	Password must be at least 8 characters in length!
	A Ensure to remember your password as there is no way to recover a lost admin password!
Exit	Choose system pages permissions in Security > Permissions

The default admin password for a Universal Robots robot arm controller is "easybot". It is a factory setting, configured on all new robots.

#### WARNING

It is critically important that you change this default admin password to your own password, to ensure cyber security of your robot.

As of PolyScope update 5.17 all security settings are set by default to restrictive (disabled or blocked). (This only applies to new robots and newly created SD-cards. Otherwise, refer to a guide "Secure setup of UR cobots").

If any of the settings are needed to be enabled for your application, you can easily enable them in the Security screen.

To use the Admin password

- 1. In the Header, tap the Hamburger menu icon and select either **System** or **Security** as desired.
- 2. Locate the dialog box at the base of the screen and enter your Admin password.
- 3. Tap Unlock.

	Settings	
> Preferences	Miscellaneous Settings	
•

V Security		
General	Restrict inbound network access to this subnet	
Secure She	0.0.0/0	
	Disable inbound access to additional interfaces (by port) 1-65535	
Exit	Admin Password Unlock Lock	

# 10.2.4. System

Description

The system settings control backup of the system, URcaps and networks settings among other.

## System Backup

Description

#### NOTICE

Use one of the USB ports inside the Control Box (CB) when doing a Backup and Restore operation. Using a CB USB port is more stable and running a Backup requires less time.

#### NOTICE

If you restore a system with a new SD card, you must match the Serial Number in the new SD card image when you start up Polyscope. Failure to match the Serial Number can result in an incomplete restore process. A restore error appears for not finding the matching serial number

Backup and Restore	Save a full copy of your system to a USB drive and use it to restore your system back to a previous state. This may be necessary after disk corruption or accidental deletion.
To backup the system	<ol> <li>In the Header, tap the Hamburger menu icon and select Settings.</li> <li>Under System, tap Backup Restore.</li> <li>Select Location to store the back-up and press Backup.</li> <li>Tap OK for full system reboot.</li> </ol>
To restore the system	<ol> <li>In the Header, tap the Hamburger menu icon and select Settings.</li> <li>Under System, tap Backup Restore.</li> <li>Select your Backup file and press Restore.</li> <li>Tap OK to confirm.</li> </ol>

# **Robot Registration and License File**

Description	It is necessary to register the robot and download and install the License File, because the license file will include all available software licenses.
Activate Remote TCP & Toolpath URCap via web	It is possible to activate the Remote TCP & Toolpath URCap directly from <u>www.universal-robots.com/activate</u> . This is only possible for Remote TCP & Toolpath URCap. If you plan to obtain additional licenses via myUR, please activate Remote TCP & Toolpath URCap first.

Activate the Software Licenses via myUR

#### NOTICE

If you have more than one active license, all licenses will be included in the downloaded license file.

If you have not registered your robot, please go to the URL on the screen at step 1 and register your robot.

- 1. Download the license file to your PC.
- 2. Copy the license file to the USB and connect it to the Teach Pendant.
- 3. On the Settings screen, in Step 3, tap Load file to open the Select license file screen.
- 4. In the list, select the USB to display content and navigate to the license file.
- 5. Select license.p7b and tap Open to confirm robot registration.
- 6. On the bottom left, tap Exit.

Deactivate Software Licenses

- A new license file is required if the robot changes owners. In this case, the license file must be deactivated.
- If you purchase a new software license for your robot, it is necessary to deactivate and reactivate the license file in order to add the new software license.
- 1. In the Header, tap the Hamburger Menu and select Settings.
- 2. In the menu on the left, tap System and select Licenses.
- 3. On the bottom right of the Settings screen, tap Deactivate.

See Activate the Software Licenses via myUR on the previous page

URCaps	
Description	Managing URCaps You can manage your existing <b>URCaps</b> or install a new one in your robot.
To manage URCaps	<ol> <li>In the Header, press the Hamburger menu and select Settings.</li> <li>Under System, select URCaps.</li> </ol>
	<ol> <li>Tap the + button, select the .urcap file and press Open.</li> <li>If you wish to proceed with the installation of that URCap, press Restart. After that step, the URCaps is installed and ready to be used.</li> </ol>
	<ol> <li>To remove an installed URCaps, select it from Active URCaps, press the - button and press Restart so changes can take effect.</li> </ol>
Active URCaps	Details about the new URCap appear in the <b>Active URCaps</b> field. A status icon indicates the state of the URCap, as listed below:
	<ul> <li>URCap ok: The URCap is installed and running normally.</li> </ul>
	<ul> <li>OURCap fault: The URCap is installed but unable to start. Contact the URCap developer.</li> </ul>
	<ul> <li>DRCap restart needed: The URCap has just been installed and a restart is required.</li> </ul>
Example	Error messages and information about the URCap appear in the <b>URCaps Information</b> field. Different error messages appear depending on the type of error/s detected.

## **Remote Control**

#### Description

A robot can either be in Local Control (controlled from the Teach Pendant) or Remote Control (controlled externally).

Remote Control allows you to control the robots via external sources, such as controller sockets, I/Os and the Dashboard Server.

This can be used to send simple commands to PolyScope such as: Starting or loading programs as well as sending UR Script commands directly to the controller.

#### CAUTION

To ensure safe usage, the robot can either be in "Remote Control" mode or "Local Control" mode.

"Local Control" mode will ensure that nay commands, sent to the controller from an external source, will be rejected while the robot is controlled in person.

#### To enable Remote Control

- 1. In the Header, tap the Hamburger menu and select **Settings**.
- 2. Under System, select Remote Control.
- 3. Tap **Enable** to make the Remote Control feature available. PolyScope remains active. Enabling Remote Control does not immediately start the feature. It allows you to switch from Local Control to Remote Control.
- 4. In the profile menu, select **Remote Control** to alter PolyScope. You can return to Local Control by switching back in the profile menu.

#### NOTICE

- Although Remote Control limits your actions in PolyScope, you can still monitor robot state.
  - When a robot system is powered off in Remote Control, it starts up in Remote Control.

Settings<br/>RequirementsControl of the robot via network or digital input is, by default, restricted.• Enable and select the Remote Control feature removes this restriction.<br/>• Enable Remote Control by switching to the Local Control profile (PolyScope

- control) of the robot, allowing all control of running programs and executing scripts to be performed remotely.
- Enable the Remote Control feature in Settings to access Remote mode and Local mode in the profile.

• Freedrive

not allow

Local Control does not allow	<ul> <li>Power on and brake release sent to the robot over network</li> <li>Receiving and executing robot programs and installation sent to the robot over network</li> <li>Autostart of programs at boot, controlled from digital inputs</li> <li>Auto brake release at boot, controlled from digital inputs</li> <li>Start of programs, controlled from digital inputs</li> </ul>
Remote Control does	

· Load programs and installations from the Teach Pendant

 Moving the robot from Move Tab • Starting from Teach Pendant

### Network

**Description** You can configure robot connection to a network by selecting one of three available network methods:

- DHCP
- Static Address
- Disabled network (if you don't wish to connect your robot to a network)

Depending on the network method you select, configure your network settings:

- IP Address
- Subnet Mask
- Default Gateway
- Preferred DNS Server
- Alternative DNS Server

## Update

Description	Install updates from a USB to ensure the robot software is up-to-date.
To update software	<ol> <li>In the Header, tap the Hamburger menu icon and select Settings.</li> <li>Under System, tap Update.</li> <li>Insert an USB and tap Search to list valid update files.</li> <li>In the list of valid update files, select desired version and tap Update to install.</li> </ol>
	WARNING Always check your program/s after a software upgrade. The upgrade

might change the trajectories in your program.

# 10.2.5. Security

**Description** You can find information on how to manage and protect your system.

### General

Description

In the General settings, you can enable magic files and configure inbound connections. A Magic File is a script on a USB drive that executes once it is inserted into the system. This function is disabled by default to make sure that magic files are not unknowingly executed on PolyScope.

	Settings
> Preferences	Miscellaneous Settings
> Password	
> System	Run Magic Files
V Security	Inbound Connections
General	Restrict inbound network access to this subnet
Secure Shel	0.0.0/0
Services	
	Disable inbound access to additional interfaces (by port)
	1-65535
Exit	Admin Password Unlock Lock

**Magic Files** Magic files have unrestricted privileges to make system changes, thus they must be considered as a security liability.

To enable Magic Files on PolyScope

- 1. In the Header, tap the Hamburger menu and select Settings.
- 2. Under Security, select General.
- 3. Enable Run Magic Files.

Restrict Inbound Connections	The network access has been set to 0.0.0.0/0 has a security setting to ensure that there is no access to the subnet in PolyScope.
	WARNING
	URCaps may require particular network interfaces to be open in order to function.
	<ul> <li>Consult your URCaps vendor/s, if any of your URCaps require particular network interfaces (ports/services) to be open.</li> </ul>
Configuring Inbound Connections	<ul> <li>Use Restrict inbound network access to a specific subnet to make sure network connections originating from an IP-address outside the indicated subnet will be refused. For example:</li> </ul>
	<ul> <li>Use 192.168.1.0/24 to only allow access from hosts in the range of 192.168.1.0 - 192.168.1.255.</li> </ul>
	Use 192.168.1.96 to allow inbound access only from this host.
	1. In the Header, tap the Hamburger menu and select Settings.
	2. Under Security, select General.
	3. Enter your Admin password.
	<ol> <li>Enter subnet restrictions under Restrict inbound network access to a specific subnet.</li> </ol>
Disable Inbound Access	Use <b>Disable inbound access to additional interfaces (by port)</b> to make sure any inboun connection to the designated ports will be refused.
	1. In the Header, tap the Hamburger menu and select Settings.
	<ol> <li>Enter the interfaces to be closed in Disable inbound access to additional interfaces (by port).</li> </ol>
	Leave the field blank to avoid blocking ports. Any enabled service Services on page 244 will take precedence over port blocking. Even if a port if blocked in the general security settings, it will be open by an enabled service.
Example	You can block all ports
·	Use 1-65535 to block all ports.
	You can block one specfic port
	You can use port number 564 to block port 564.
	You can block a range of ports
	<ul> <li>Use ranges to block a specific range of ports. 2318-3412, 22, 56-67 to block specific ports and specific ranges of ports.</li> </ul>

## Secure Shell

**Description** Secure Shell (SSH) provides a private (encrypted) and authenticated connection to the robot allowing:

- · operating system access
- file copying
- · tunneling of network interfaces

#### NOTICE

SSH is a powerful tool if used as intended. Make sure you understand how to use SSH technology securely before you enable it on your robot.

		iversal Robots Graphical Programming Environm	ent

Exit		Admin Password	Unlock	Lock	
	1				
			_		
Power off		Speed 100%			

To enable SSH

Access

1. In the Header, tap the Hamburger menu and select **Settings**.

2. Under Security, select Secure Shell.

3. Configure the Secure Shell Settings:

- Select Enable SSH Access.
- Select to enable/disable Allow Port Forwarding (when in remote control mode).

Port forwarding is only available in remote control mode.

Port forwarding is a recommended technique for wrapping open interfaces (eg. the Dashboard service) in a secure and encrypted tunnel requiring authentication.

4. Select the Authentication type.

Authentication Any SSH connection requires the connecting user to authenticate when the connection is established. You can set up authentication with a password and/or with a pre-shared, authorized key. Key based authentication relies on pre-shared keys. To use Available keys are listed here together with buttons for removing a selected key from the Authentication

list and for adding new keys.

- 1. Tap Add to open a file selection dialog.
- 2. Select a key from the file.

The file is read line by line adding only lines which are not blank and not identified as comments (starting with #). No validation of lines added is done.

3. They must comply with the format used for authorized\_keys.

## Services

Description

Services lists the standard services running on the robot. You can enable or disable each service.

#### NOTICE

All services are disabled as a security feature. When you start or configure your robot, you have to enable relevant services.

An enabled service remains available even if the ports associated with that service are blocked. So, simply blocking a port is not enough to prevent access to the listed services if they are enabled.

#### Enabling Services

You have to enable the relevant service for the function that you are using.

To enable Services

- 1. In the Header, tap the Hamburger menu and select **Settings**.
- 2. Under Security, select Services.
- 3. In the list, select an option and tap **Enable**, or tap **Disable**.

	Settings	
> Preferences	Services Settings	
> Password	Please be advised to keep unused interfaces disabled to improve security	
<b>&gt;</b> System		
✓ Security	Enable or disable inbound access to standard interfaces

Secure Shell	Disabled Primary Client Interface	^
Services	Disabled Secondary Client Interface Disabled Real-Time Client Interface Disabled Real-Time Data Exchange (RTDE) Disabled Interpreter Mode Socket Disabled Modbus TCP Disabled PROFINET Disabled EtherNet/IP	~
Exit	Admin Password Unlock Lock	

Description	In Permissions you can restrict the settings in the System section with Administrative password protection.	
Using Permissions	You have to enable a permission to be restricted and disable the permission for the restriction to be removed. Before you can enable/disable Permissions, you have to unlock the Security Settings.	
To unlock Security Settings	1. In the Header, tap the Hamburger menu.	
	2. Select Settings.	
	3. Under Security, select <b>Permissions</b> .	
	4. At the bottom of the screen tap <b>Admin Password</b> .	
	5. Use the on-screen keyboard to enter your password and tap <b>Submit</b> .	
	You can now access and configure the all Settings including Permissions	
	Navigating away from the Security Settings locks the screen again.	
To enable/disable Permissions	Once you unlock the Settings, you can select any of the options in the list. Selecting an option, removes the checkmark and allows access to that selection. 1. On the Permissions screen, select an option from the list to remove the	
	checkmark.	
	The selection is unlocked.	
	2. To lock the option again, select it again to add the checkmark.	
	The selection is locked.
